
Energy-Log-Server-7.x Documentation

Release 7.0.3

Sep 22, 2020

Contents

1	About	1
2	Introduction	3
2.1	Elasticsearch	4
2.2	Kibana	4
2.3	Logstash	4
2.4	ELK	5
3	Data source and application management	7
3.1	Data source	7
3.2	System services	7
3.3	First configuration steps	8
3.4	First login	12
3.5	Index selection	14
3.6	Changing default users for services	15
3.7	Custom installation the Energy Logserver	16
3.8	Plugins management in the Elasticsearch	20
3.9	ROOTless management	21
3.10	Energy Logserver Elasticsearch encryption	22
3.11	Transport layer encryption	23
3.12	HTTP layer encryption	24
4	Discovery	27
4.1	Time settings and refresh	27
4.2	Fields	29
4.3	Filtering and syntax building	30
4.4	Saving and deleting queries	32
4.5	Manual incident	34
5	Visualizations	35
5.1	Creating visualization	35
5.2	Vizualization types	38
5.3	Edit visualization and saving	39
5.4	Dashboards	42
5.5	Sharing dashboards	43
5.6	Dashboard drilldown	44

6	Reports	49
6.1	CSV Report	50
6.2	PDF Report	53
6.3	Scheduler Report (Schedule Export Dashboard)	55
7	User roles and object management	59
7.1	Users, roles and settings	59
7.2	Creating a User (Create User)	61
7.3	Create, modify and delete a role (Create Role), (Role List)	62
7.4	Default user and passwords	66
7.5	Changing password for the system account	67
8	Settings	69
8.1	General Settings	69
8.2	License (License Info)	71
8.3	Special accounts	71
9	Alert Module	73
9.1	Enabling the Alert Module	73
9.2	Creating Alerts	74
9.3	Alerts status	77
9.4	Alert rules	77
9.5	Alert Type	80
9.6	Example of rules	81
9.7	Playbooks	87
9.8	Risks	90
9.9	Indicators of compromise (IoC)	96
10	Intelligence Module	99
10.1	The fixed part of the screen	101
10.2	Screen content for regressive algorithms	103
10.3	Screen content for the Trend algorithm	105
10.4	Screen content for the neural network (MLP) algorithm	107
10.5	AI Rules List	109
10.6	AI Learn	111
10.7	AI Learn Tasks	113
10.8	Scenarios of using algorithms implemented in the Intelligence module	114
10.9	Scheduler Module	115
10.10	Permission	117
10.11	Register new algorithm	117
11	Verification steps and logs	121
11.1	Verification of Elasticsearch service	121
11.2	Verification of Logstash service	122
12	Building a cluster	125
12.1	Node roles	125
12.2	Naming convention	125
12.3	Config files	126
12.4	Example setup	126
12.5	Adding a new node to existing cluster	127
13	Integration with AD	129
13.1	AD configuration	129
13.2	Configure SSL suport for AD authentication	131

13.3	Role mapping	138
13.4	Password encryption	138
14	Integration with Radius	141
14.1	Configuration	141
15	Integration with LDAP	143
15.1	Configuration	143
16	Configuring Single Sign On (SSO)	145
16.1	Configuration steps	145
16.2	Client (Browser) Configuration##	147
17	Configure email delivery	153
17.1	Configure email delivery for sending PDF reports in Scheduler.	153
17.2	Basic <i>postfix</i> configuration	156
17.3	Example of postfix configuration with SSL encryption enabled	156
18	API	159
18.1	Kibana API	159
18.2	Elasticsearch API	160
18.3	Elasticsearch Index API	160
18.4	Elasticsearch Document API	163
18.5	Elasticsearch Cluster API	166
18.6	Elasticsearch Search API	167
18.7	Elasticsearch - Mapping, Fielddata and Templates	167
18.8	AI Module API	169
18.9	Alert module API	178
18.10	Reports module API	180
18.11	License module API	182
18.12	User Module API	182
19	Logstash	183
19.1	Logstash - Input “beats”	183
19.2	Logstash - Input “network”	185
19.3	Logstash - Input SNMP	185
19.4	Logstash - Input HTTP / HTTPS	185
19.5	Logstash - Input File	186
19.6	Logstash - Input database	186
19.7	Logstash - Filter “beats syslog”	188
19.8	Logstash - Filter “network”	189
19.9	Logstash - Filter “geoip”	192
19.10	Logstash - Output to Elasticsearch	193
19.11	Logstash plugin for “naemon beat”	193
19.12	Logstash plugin for “perflog”	194
19.13	Single password in all Logstash outputs	195
19.14	Secrets keystore for secure settings	195
19.15	Enabling encryption for Apache Kafka clients	196
20	Integrations	201
20.1	OP5 - Naemon logs	201
20.2	OP5 - Performance data	203
20.3	OP5 Beat	206
20.4	The Grafana instalation	207
20.5	The Beats configuration	210

20.6	Wazuh integration	210
20.7	BRO integration	211
20.8	2FA authorization with Google Auth Provider (example)	211
20.9	Cerebro - Elasticsearch web admin tool	214
20.10	Curator - Elasticsearch index management tool	216
20.11	Cross-cluster Search	220
20.12	Sync/Copy	222
20.13	XLSX Import	225
20.14	Logtrail	227
21	Troubleshooting	233
21.1	Recovery default base indexes	233
21.2	Too many open files	234
21.3	The Kibana status code 500	235
21.4	Diagnostic tool	235
22	Upgrades	237
22.1	Upgrade from version 7.0.1	237
22.2	Changing OpenJDK version	238
23	Agents module	241
23.1	Component modules	241
23.2	Table of configuration parameter for Agent software	241
23.3	Installing agent software	242
23.4	TLS configuration	245
23.5	The agent management	246
24	Monitoring	249
24.1	Skimmer	249
24.2	Skimmer Installation	250
24.3	Skimmer service configuration	250
25	Kafka	253
25.1	Enabling encryption for Apache Kafka clients	253
25.2	Log retention for Kafka topic	256
26	CHANGELOG	257
26.1	v7.0.3	257
26.2	Version 7.0.2	259
26.3	Version 7.0.1	260

CHAPTER 1

About

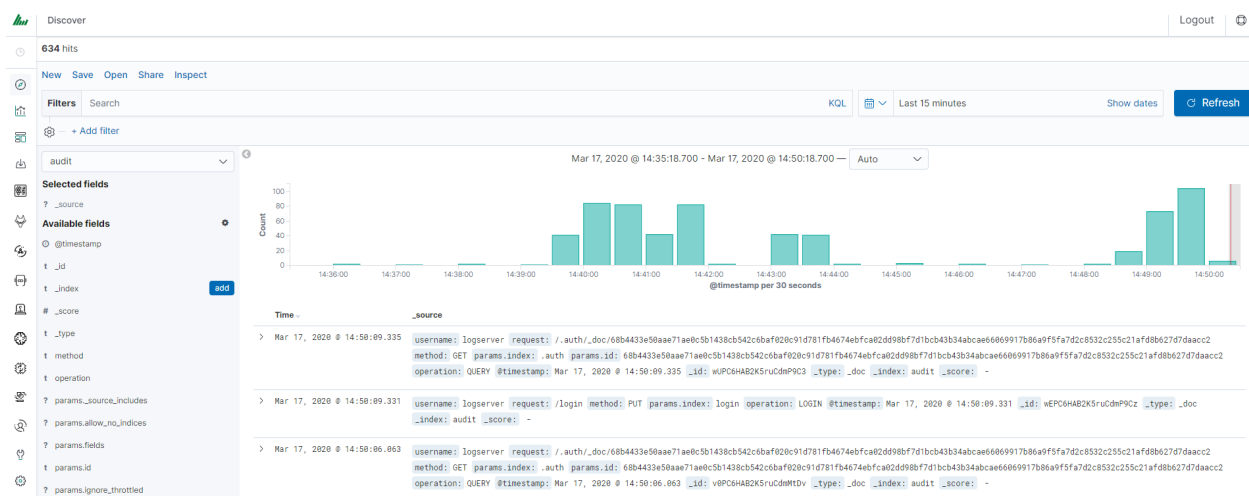

Energy Logserver User Guide

Software ver. 7.x

CHAPTER 2

Introduction

Energy Logserver is innovation solution allowing for centralize IT systems events. It allows for an immediately review, analyze and reporting of system logs - the amount of data does not matter. Energy Logserver is a response to the huge demand for storage and analysis of the large amounts of data from IT systems. Energy Logserver is innovation solution that responds to the need of effectively processing large amounts of data coming from IT environments of today's organizations. Based on the open-source project Elasticsearch valued on the marked, we have created an efficient solution with powerful data storage and searching capabilities. The System has been enriched of functionality that ensures the security of stored information, verification of users, data correlation and visualization, alerting and reporting.

Energy Logserver project was created to centralize events of all IT areas in the organization. We focused on creating a tool that functionality is most expected by IT departments. Because an effective licensing model has been applied, the solution can be implemented in the scope expected by the customer even with very large volume of data. At the same time, the innovation architecture allows for servicing a large portion of data, which cannot be dedicated to solution with limited scalability.

2.1 Elasticsearch

Elasticsearch is a NoSQL database solution that is the heart of our system. Text information sent to the system, application and system logs are processed by Logstash filters and directed to Elasticsearch. This storage environment creates, based on the received data, their respective layout in a binary form, called a data index. The Index is kept on Elasticsearch nodes, implementing the appropriate assumptions from the configuration, such as:

- Replication index between nodes,
- Distribution index between nodes.

The Elasticsearch environment consists of nodes:

- Data node - responsible for storing documents in indexes,
- Master node - responsible for the supervisions of nodes,
- Client node - responsible for cooperation with the client.

Data, Master and Client elements are found even in the smallest Elasticsearch installations, therefore often the environment is referred to as a cluster, regardless of the number of nodes configured. Within the cluster, Elasticsearch decides which data portions are held on a specific node.

Index layout, their name, set of fields is arbitrary and depends on the form of system usage. It is common practice to put data of a similar nature to the same type of index that has a permanent first part of the name. The second part of the name often remains the date the index was created, which in practice means that the new index is created every day. This practice, however, is conventional and every index can have its own rotation convention, name convention, construction scheme and its own set of other features. As a result of passing document through the Logstash engine, each entry receives a data field, which allows to work with data in relation to time.

The Indexes are built with elementary part called shards. It is good practice to create Indexes with the number of shards that is the multiple of the Elasticsearch data nodes number. Elasticsearch in 7.x version has a new feature called Sequence IDs that guarantee more successful and efficient shard recovery.

Elasticsearch uses the *mapping* to describe the fields or properties that documents of that type may have. Elasticsearch in 7.x version restricts indices to a single type.

2.2 Kibana

Kibana lets you visualize your Elasticsearch data and navigate the Elastic Stack. Kibana gives you the freedom to select the way you give shape to your data. And you don't always have to know what you're looking for. Kibana core ships with the classics: histograms, line graphs, pie charts, sunbursts, and more. Plus, you can use Vega grammar to design your own visualizations. All leverage the full aggregation capabilities of Elasticsearch. Perform advanced time series analysis on your Elasticsearch data with our curated time series UIs. Describe queries, transformations, and visualizations with powerful, easy-to-learn expressions. Kibana 7.x has two new features - a new "Full-screen" mode to viewing dashboards, and new the "Dashboard-only" mode which enables administrators to share dashboards safely.

2.3 Logstash

Logstash is an open source data collection engine with real-time pipelining capabilities. Logstash can dynamically unify data from disparate sources and normalize the data into destinations of your choice. Cleanse and democratize all your data for diverse advanced downstream analytics and visualization use cases.

While Logstash originally drove innovation in log collection, its capabilities extend well beyond that use case. Any type of event can be enriched and transformed with a broad array of input, filter, and output plugins, with many native

codecs further simplifying the ingestion process. Logstash accelerates your insights by harnessing a greater volume and variety of data.

Logstash 7.x version supports native support for multiple pipelines. These pipelines are defined in a *pipelines.yml* file which is loaded by default. Users will be able to manage multiple pipelines within Kibana. This solution uses Elasticsearch to store pipeline configurations and allows for on-the-fly reconfiguration of Logstash pipelines.

2.4 ELK

“ELK” is the acronym for three open source projects: Elasticsearch, Logstash, and Kibana. Elasticsearch is a search and analytics engine. Logstash is a server-side data processing pipeline that ingests data from multiple sources simultaneously, transforms it, and then sends it to a “stash” like Elasticsearch. Kibana lets users visualize data with charts and graphs in Elasticsearch. The Elastic Stack is the next evolution of the ELK Stack.

Data source and application management

3.1 Data source

Where does the data come from?

Energy Logserver is a solution allowing effective data processing from the IT environment that exists in the organization.

The Elasticsearch engine allows building a database in which large amounts of data are stored in ordered indexes. The Logstash module is responsible for load data into Indexes, whose function is to collect data on specific tcp/udp ports, filter them, normalize them and place them in the appropriate index. Additional plugins, that we can use in Logstash reinforce the work of the module, increase its efficiency, enabling the module to quick interpret data and parse it.

Below is an example of several of the many available Logstash plugins:

exec - receive output of the shell function as an event;

imap - read email from IMAP servers;

jdbc - create events based on JDC data;

jms - create events from Jms broker;

Both Elasticsearch and Logstash are free Open-Source solutions.

More information about Elasticsearch module can be find at: <https://github.com/elastic/elasticsearch>

List of available Logstash plugins: <https://github.com/elastic/logstash-docs/tree/master/docs/plugins>

3.2 System services

For proper operation Energy Logserver requires starting the following system services:

- `elasticsearch.service` - we can run it with a command:

```
systemctl start elasticsearch.service
```

we can check its status with a command:

```
systemctl status elasticsearch.service
```

```
[root@collector1 centos]# systemctl status elasticsearch
● elasticsearch.service - Elasticsearch
   Loaded: loaded (/usr/lib/systemd/system/elasticsearch.service; enabled; vendor preset: disabled)
   Active: active (running) since Fri 2020-03-20 13:03:21 UTC; 4 days ago
     Docs: http://www.elastic.co
   Main PID: 1586 (java)
   CGroup: /system.slice/elasticsearch.service
           └─1586 /bin/java -Xms4g -Xmx4g -Djava.security.manager -Djava.security.policy=/usr/share/elasticsearch/plugins/elasticsearch-auth/java.poli...
```

- kibana.service - we can run it with a command:

```
systemctl start kibana.service
```

we can check its status with a command:

```
systemctl status kibana.service
```

```
[root@collector1 centos]# systemctl status kibana
● kibana.service - Kibana
   Loaded: loaded (/etc/systemd/system/kibana.service; enabled; vendor preset: disabled)
   Active: active (running) since Fri 2020-03-20 14:08:37 UTC; 4 days ago
     Main PID: 17248 (node)
     CGroup: /system.slice/kibana.service
           └─17248 /usr/share/kibana/bin/../node/bin/node --no-warnings /usr/share/kibana/bin/../src/cli -c /etc/kibana/kibana.yml

Mar 24 14:40:39 collector1 kibana[17248]: {"type":"response","@timestamp":"2020-03-24T14:40:39Z","tags":[],"pid":17248,"method":"get","status...pplicatio

Hint: Some lines were ellipsized, use -l to show in full.
```

3.3 First configuration steps

3.3.1 Run the instalation

The Energy Logserver installer is delivered as:

- RPM package energy-logserver-data-node and energy-logserver-client-node
- “install.sh” installation script

Installation using the RPM package

1. Install OpenJDK / Oracle JDK version 11:

```
yum -y -q install java-11-openjdk-headless.x86_64
```

2. Select default command for OpenJDK /Oracle JDK:

```
alternatives --config java
```

3. Upload Package

```
scp ./energy-logserver-data-node-7.0.1-1.el7.x86_64.rpm root@hostname:~/
scp ./energy-logserver-client-node-7.0.1-1.el7.x86_64.rpm root@hostname:~/
```

4. Install Energy Logserver Data Node

```
yum install ./energy-logserver-data-node-7.0.1-1.el7.x86_64.rpm
```

5. Verification of Configuration Files

Please, verify your Elasticsearch configuration and JVM configuration in files:

- /etc/elasticsearch/jvm.options – check JVM HEAP settings and another parameters

```
## -Xms4g
## -Xmx4g
# Xms represents the initial size of total heap space
# Xmx represents the maximum size of total heap space
-Xms600m
-Xmx600m
```

- /etc/elasticsearch/elasticsearch.yml – verify elasticsearch configuration file

6. Start and enable Elasticsearch service If everything went correctly, we will start the Elasticsearch instance:

```
systemctl start elasticsearch
```

```
systemctl status elasticsearch
elasticsearch.service - Elasticsearch
  Loaded: loaded (/usr/lib/systemd/system/elasticsearch.service; enabled; vendor_
  ↳ preset: disabled)
  Active: active (running) since Wed 2020-03-18 16:50:15 CET; 57s ago
  Docs: http://www.elastic.co
  Main PID: 17195 (java)
  CGroup: /system.slice/elasticsearch.service
           └─17195 /etc/alternatives/jre/bin/java -Xms512m -Xmx512m -Djava.
  ↳ security.manager -Djava.security.policy=/usr/share/elasticsearch/plugins/
  ↳ elasticsearch_auth/plugin-securi...

Mar 18 16:50:15 migration-01 systemd[1]: Started Elasticsearch.
Mar 18 16:50:25 migration-01 elasticsearch[17195]: SSL not activated for http and/
  ↳ or transport.
Mar 18 16:50:33 migration-01 elasticsearch[17195]: SLF4J: Failed to load class
  ↳ "org.slf4j.impl.StaticLoggerBinder".
```

(continues on next page)

(continued from previous page)

```
Mar 18 16:50:33 migration-01 elasticsearch[17195]: SLF4J: Defaulting to no-  
↳operation (NOP) logger implementation  
Mar 18 16:50:33 migration-01 elasticsearch[17195]: SLF4J: See http://www.slf4j.  
↳org/codes.html#StaticLoggerBinder for further details.
```

7. Check cluster/indices status and Elasticsearch version

Invoke curl command to check the status of Elasticsearch:

```
curl -s -u $CREDENTIAL localhost:9200/_cluster/health?pretty  
{  
  "cluster_name" : "elasticsearch",  
  "status" : "green",  
  "timed_out" : false,  
  "number_of_nodes" : 1,  
  "number_of_data_nodes" : 1,  
  "active_primary_shards" : 25,  
  "active_shards" : 25,  
  "relocating_shards" : 0,  
  "initializing_shards" : 0,  
  "unassigned_shards" : 0,  
  "delayed_unassigned_shards" : 0,  
  "number_of_pending_tasks" : 0,  
  "number_of_in_flight_fetch" : 0,  
  "task_max_waiting_in_queue_millis" : 0,  
  "active_shards_percent_as_number" : 100.0  
}
```

```
curl -s -u $CREDENTIAL localhost:9200  
{  
  "name" : "node-1",  
  "cluster_name" : "elasticsearch",  
  "cluster_uuid" : "igrASEDRRamyQgy-zJRSfg",  
  "version" : {  
    "number" : "7.3.2",  
    "build_flavor" : "oss",  
    "build_type" : "rpm",  
    "build_hash" : "1c1faf1",  
    "build_date" : "2019-09-06T14:40:30.409026Z",  
    "build_snapshot" : false,  
    "lucene_version" : "8.1.0",  
    "minimum_wire_compatibility_version" : "6.8.0",  
    "minimum_index_compatibility_version" : "6.0.0-beta1"  
  },  
  "tagline" : "You Know, for Search"  
}
```

If everything went correctly, we should see 100% allocated shards in cluster health.

8. Install Energy Logserver Client Node

```
yum install ./energy-logserver-client-node-7.0.1-1.el7.x86_64.rpm
```

9. Start Energy Logserver GUI

Add service:

- Kibana

- Cerebro
- Alert

to autostart and add port (5602/TCP) for Cerebro. Run them and check status:

```
firewall-cmd --permanent --add-port 5602/tcp
firewall-cmd --reload
```

```
systemctl enable kibana cerebro alert
```

```
systemctl start kibana cerebro alert
systemctl status kibana cerebro alert
```

Installation using “install.sh”

During installation you will be asked about following tasks:

- install & configure Logstash with custom Energy Logserver Configuration - like Beats, Syslog, Blacklist, Netflow, Wazuh, Winrm, Logtrail, OP5, etc;
- install the Energy Logserver Client Node, as well as the other client-node dependencies;
- install the Energy Logserver Data Node, as well as the other data-node dependencies;
- load the Energy Logserver custom dashboards, alerts and configs;

Post installation steps

- copy license files to Elasticsearch directory

```
cp es.* /usr/share/elasticsearch/bin/
```

- configure Elasticsearch cluster settings

```
vi /etc/elasticsearch/elasticsearch.yml

add all IPs of Elasticsearch node in the following directive:
discovery.zen.ping.unicast.hosts: [ "172.10.0.1:9300", "172.10.0.2:9300" ]
```

- start Elasticsearch service

```
systemctl start elasticsearch
```

- start Logstash service

```
systemctl start logstash
```

- start Cerebro service

```
systemctl start cerebro
```

- start Kibana service

```
systemctl start kibana
```

- start Alert service

```
systemctl start alert
```

- start Skimmer service

```
systemctl start skimmer
```

- Example agent configuration files and additional documentation can be found in the Agents directory:
 - filebeat
 - winlogbeat
 - op5 naemon logs
 - op5 perf_data
- For blacklist creation, you can use crontab or kibana scheduler, but the most preferable method is logstash input. Instructions to set it up can be found at `logstash/lists/README.md`
- It is recommended to make small backup of system indices - copy “small_backup.sh” script from Agents directory to desired location, and change `backupPath=` to desired location. Then set up a crontab:

```
0 1 * * * /path/to/script/small_backup.sh
```

- Redirect Kibana port 5601/TCP to 443/TCP

```
firewall-cmd --zone=public --add-masquerade --permanent  
firewall-cmd --zone=public --add-forward-port=port=443:proto=tcp:toport=5601 --  
→permanent  
firewall-cmd --reload
```

NOTE: Kibana on 443 tcp port *without* redirection needs additional permissions:

```
setcap 'CAP_NET_BIND_SERVICE=+eip' /usr/share/kibana/node/bin/node
```

- Cookie TTL and Cookie Keep Alive - for better work comfort, you can set two new variables in the Kibana configuration file `/etc/kibana/kibana.yml`:

```
login.cookiettl: 10  
login.cookieKeepAlive: true
```

CookieTTL is the value in minutes of the cookie’s lifetime. The cookieKeepAlive renews this time with every valid query made by browser clicks.

After saving changes in the configuration file, you must restart the service:

```
systemctl restart kibana
```

3.4 First login

If you log in to Energy Logserver for the first time, you must specify the Index to be searched. We have the option of entering the name of your index, indicate a specific index from a given day, or using the asterix (*) to indicate all of them matching a specific index pattern. Therefore, to start working with Energy Logserver application, we log in to it (by default the user: `logserver/password:logserver`).

Please sign in

Username

Password

Sign in

After logging in to the application click the button “Set up index pattern” to add new index patter in Kibana:

In the “Index pattern” field enter the name of the index or index pattern (after confirming that the index or sets of indexes exists) and click “Next step” button.

In the next step, from drop down menu select the “Time filter field name”, after witch individual event (events) should be sorter. By default the *timestamp* is set, which is the time of occurrence of the event, but depending of the preferences. It may also be the time of the indexing or other selected based on the fields indicate on the event.

At any time, you can add more indexes or index patterns by going to the main tab select „Management” and next select „Index Patterns”.

3.5 Index selection

After login into Energy Logserver you will go to „Discover” tab, where you can interactively explore your data. You have access to every document in every index that matches the selected index patterns.

If you want to change selected index, drop down menu with the name of the current object in the left panel. Clicking on the object from the expanded list of previously create index patterns, will change the searched index.

3.6 Changing default users for services

3.6.1 Change Kibana User

Edit file `/etc/systemd/system/kibana.service`

```
User=newuser
Group= newuser
```

Edit `/etc/default/kibana`

```
user=" newuser "
group=" newuser "
```

Add appropriate permission:

```
chown newuser: /usr/share/kibana/ /etc/kibana/ -R
```

3.6.2 Change Elasticsearch User

Edit `/usr/lib/tmpfiles.d/elasticsearch.conf` and change user name and group:

```
d /var/run/elasticsearch 0755 newuser newuser -
```

Create directory:

```
mkdir /etc/systemd/system/elasticsearch.service.d/
```

Edit `/etc/systemd/system/elasticsearch.service.d/01-user.conf`

```
[Service]
User=newuser
Group= newuser
```

Add appropriate permission:

```
chown -R newuser: /var/lib/elasticsearch /usr/share/elasticsearch /etc/
↪elasticsearch /var/log/elasticsearch
```

3.6.3 Change Logstash User

Create directory:

```
mkdir /etc/systemd/system/logstash.service.d
```

Edit `/etc/systemd/system/logstash.service.d/01-user.conf`

```
[Service]
User=newuser
Group=newuser
```

Add appropriate permission:

```
chown -R newuser: /etc/logstash /var/log/logstash
```

3.7 Custom installation the Energy Logserver

If you need to install Energy Logserver in non-default location, use the following steps.

1. Define the variable `INSTALL_PATH` if you do not want default paths like `"/`

```
export INSTALL_PATH="/"
```

2. Install the `firewalld` service

```
yum install firewalld
```

3. Configure the `firewalld` service

```
systemctl enable firewalld
systemctl start firewalld
firewall-cmd --zone=public --add-port=22/tcp --permanent
firewall-cmd --zone=public --add-port=443/tcp --permanent
firewall-cmd --zone=public --add-port=5601/tcp --permanent
firewall-cmd --zone=public --add-port=9200/tcp --permanent
firewall-cmd --zone=public --add-port=9300/tcp --permanent
firewall-cmd --reload
```

4. Install and enable the `epel` repository

```
yum install epel-release
```

5. Install the Java OpenJDK

```
yum install java-1.8.0-openjdk-headless.x86_64
```

6. Install the reports dependencies, e.g. for mail and fonts

```
yum install fontconfig freetype freetype-devel fontconfig-devel libstdc++ urw-
↪ fonts net-tools ImageMagick ghostscript poppler-utils
```

7. Create the nessesery users accounts

```
useradd -M -d ${INSTALL_PATH}/usr/share/kibana -s /sbin/nologin kibana
useradd -M -d ${INSTALL_PATH}/usr/share/elasticsearch -s /sbin/nologin_
↪ elasticsearch
useradd -M -d ${INSTALL_PATH}/opt/alert -s /sbin/nologin alert
```

8. Remove `.gitkeep` files from source directory

```
find . -name ".gitkeep" -delete
```

9. Install the Elasticsearch 6.2.4 files

```
/bin/cp -rf elasticsearch/elasticsearch-6.2.4/* ${INSTALL_PATH}/
```

10. Install the Kibana 6.2.4 files

```
/bin/cp -rf kibana/kibana-6.2.4/* ${INSTALL_PATH}/
```

11. Configure the Elasticsearch system dependencies

```
/bin/cp -rf system/limits.d/30-elasticsearch.conf /etc/security/limits.d/
/bin/cp -rf system/sysctl.d/90-elasticsearch.conf /etc/sysctl.d/
/bin/cp -rf system/sysconfig/elasticsearch /etc/sysconfig/
/bin/cp -rf system/rsyslog.d/intelligence.conf /etc/rsyslog.d/
echo -e "RateLimitInterval=0\nRateLimitBurst=0" >> /etc/systemd/journald.conf
systemctl daemon-reload
systemctl restart rsyslog.service
sysctl -p /etc/sysctl.d/90-elasticsearch.conf
```

12. Configure the SSL Encryption for the Kibana

```
mkdir -p ${INSTALL_PATH}/etc/kibana/ssl
openssl req -x509 -nodes -days 365 -newkey rsa:2048 -sha256 -subj '/CN=LOGSERVER/'
↪subjectAltName=LOGSERVER/' -keyout ${INSTALL_PATH}/etc/kibana/ssl/kibana.key -
↪out ${INSTALL_PATH}/etc/kibana/ssl/kibana.crt
```

13. Install the Elasticsearch-auth plugin

```
cp -rf elasticsearch/elasticsearch-auth ${INSTALL_PATH}/usr/share/elasticsearch/
↪plugins/elasticsearch-auth
```

14. Install the Elasticsearch configuration files

```
/bin/cp -rf elasticsearch/*.yml ${INSTALL_PATH}/etc/elasticsearch/
```

15. Install the Elasticsearch system indices

```
mkdir -p ${INSTALL_PATH}/var/lib/elasticsearch
/bin/cp -rf elasticsearch/nodes ${INSTALL_PATH}/var/lib/elasticsearch/
```

16. Add necessary permission for the Elasticsearch directories

```
chown -R elasticsearch:elasticsearch ${INSTALL_PATH}/usr/share/elasticsearch $
↪${INSTALL_PATH}/etc/elasticsearch ${INSTALL_PATH}/var/lib/elasticsearch $
↪${INSTALL_PATH}/var/log/elasticsearch
```

17. Install the Kibana plugins

```
cp -rf kibana/plugins/* ${INSTALL_PATH}/usr/share/kibana/plugins/
```

18. Extrac the node_modules for plugins and remove archive

```
tar -xf ${INSTALL_PATH}/usr/share/kibana/plugins/node_modules.tar -C ${INSTALL_
↪PATH}/usr/share/kibana/plugins/
/bin/rm -rf ${INSTALL_PATH}/usr/share/kibana/plugins/node_modules.tar
```

19. Install the Kibana reports binaries

```
cp -rf kibana/export_plugin/* ${INSTALL_PATH}/usr/share/kibana/bin/
```

20. Create directory for the Kibana reports

```
/bin/cp -rf kibana/optimize ${INSTALL_PATH}/usr/share/kibana/
```

21. Install the python dependencies for reports

```
tar -xf kibana/python.tar -C /usr/lib/python2.7/site-packages/
```

22. Install the Kibana custom sources

```
/bin/cp -rf kibana/src/* ${INSTALL_PATH}/usr/share/kibana/src/
```

23. Install the Kibana configuration

```
/bin/cp -rf kibana/kibana.yml ${INSTALL_PATH}/etc/kibana/kibana.yml
```

24. Generate the iron secret salt for Kibana

```
echo "server.ironsecret: \"$(</dev/urandom tr -dc _A-Z-a-z-0-9 | head -c32)\"" >>  
→ ${INSTALL_PATH}/etc/kibana/kibana.yml
```

25. Remove old cache files

```
rm -rf ${INSTALL_PATH}/usr/share/kibana/optimize/bundles/*
```

26. Install the Alert plugin

```
mkdir -p ${INSTALL_PATH}/opt  
/bin/cp -rf alert ${INSTALL_PATH}/opt/alert
```

27. Install the AI plugin

```
/bin/cp -rf ai ${INSTALL_PATH}/opt/ai
```

28. Set the proper permissions

```
chown -R elasticsearch:elasticsearch ${INSTALL_PATH}/usr/share/elasticsearch/  
chown -R alert:alert ${INSTALL_PATH}/opt/alert  
chown -R kibana:kibana ${INSTALL_PATH}/usr/share/kibana ${INSTALL_PATH}/opt/ai $  
→ ${INSTALL_PATH}/opt/alert/rules ${INSTALL_PATH}/var/lib/kibana  
chmod -R 755 ${INSTALL_PATH}/opt/ai  
chmod -R 755 ${INSTALL_PATH}/opt/alert
```

29. Install service files for the Alert, Kibana and the Elasticsearch

```
/bin/cp -rf system/alert.service /usr/lib/systemd/system/alert.service  
/bin/cp -rf kibana/kibana-6.2.4/etc/systemd/system/kibana.service /usr/lib/  
→ systemd/system/kibana.service  
/bin/cp -rf elasticsearch/elasticsearch-6.2.4/usr/lib/systemd/system/  
→ elasticsearch.service /usr/lib/systemd/system/elasticsearch.service
```

30. Set property paths in service files \${INSTALL_PATH}

```
perl -pi -e 's#/opt#${INSTALL_PATH}/opt#g' /usr/lib/systemd/system/alert.  
→ service  
perl -pi -e 's#/etc#${INSTALL_PATH}/etc#g' /usr/lib/systemd/system/kibana.  
→ service  
perl -pi -e 's#/usr#${INSTALL_PATH}/usr#g' /usr/lib/systemd/system/kibana.  
→ service
```

(continues on next page)

(continued from previous page)

```
perl -pi -e 's#ES_HOME=#ES_HOME='${INSTALL_PATH}'#g' /usr/lib/systemd/system/
↪elasticsearch.service
perl -pi -e 's#ES_PATH_CONF=#ES_PATH_CONF='${INSTALL_PATH}'#g' /usr/lib/systemd/
↪system/elasticsearch.service
perl -pi -e 's#ExecStart=#ExecStart='${INSTALL_PATH}'#g' /usr/lib/systemd/system/
↪elasticsearch.service
```

31. Enable the system services

```
systemctl daemon-reload
systemctl reenale alert
systemctl reenale kibana
systemctl reenale elasticsearch
```

32. Set location for Elasticsearch data and logs files in configuration file

- Elasticsearch

```
perl -pi -e 's#path.data: #path.data: '${INSTALL_PATH}'#g' ${INSTALL_PATH}/
↪etc/elasticsearch/elasticsearch.yml
perl -pi -e 's#path.logs: #path.logs: '${INSTALL_PATH}'#g' ${INSTALL_PATH}/
↪etc/elasticsearch/elasticsearch.yml
perl -pi -e 's#/usr#${INSTALL_PATH}'/usr#g' ${INSTALL_PATH}/etc/
↪elasticsearch/jvm.options
perl -pi -e 's#/usr#${INSTALL_PATH}'/usr#g' /etc/sysconfig/elasticsearch
```

- Kibana

```
perl -pi -e 's#/etc#${INSTALL_PATH}'/etc#g' ${INSTALL_PATH}/etc/kibana/
↪kibana.yml
perl -pi -e 's#/opt#${INSTALL_PATH}'/opt#g' ${INSTALL_PATH}/etc/kibana/
↪kibana.yml
perl -pi -e 's#/usr#${INSTALL_PATH}'/usr#g' ${INSTALL_PATH}/etc/kibana/
↪kibana.yml
```

- AI

```
perl -pi -e 's#/opt#${INSTALL_PATH}'/opt#g' ${INSTALL_PATH}/opt/ai/bin/
↪conf.cfg
```

33. What next ?

- Upload License file to \${INSTALL_PATH}/usr/share/elasticsearch/directory.
- Setup cluster in \${INSTALL_PATH}/etc/elasticsearch/elasticsearch.yml

```
discovery.zen.ping.unicast.hosts: [ "172.10.0.1:9300", "172.10.0.2:9300" ]
```

- Redirect GUI to 443/tcp

```
firewall-cmd --zone=public --add-masquerade --permanent
firewall-cmd --zone=public --add-forward-
↪port=port=443:proto=tcp:toport=5601 --permanent
firewall-cmd --reload
```

3.8 Plugins management in the Elasticsearch

Base installation of the Energy Logserver contains the *elasticsearch-auth* plugin. You can extend the basic Elasticsearch functionality by installing the custom plugins.

Plugins contain JAR files, but may also contain scripts and config files, and must be installed on every node in the cluster.

After installation, each node must be restarted before the plugin becomes visible.

The Elasticsearch provides two categories of plugins:

- Core Plugins - it is plugins that are part of the Elasticsearch project.
- Community contributed - it is plugins that are external to the Elasticsearch project

3.8.1 Installing Plugins

Core Elasticsearch plugins can be installed as follows:

```
cd /usr/share/elasticsearch/  
bin/elasticsearch-plugin install [plugin_name]
```

Example:

```
bin/elasticsearch-plugin install ingest-geoip  
  
-> Downloading ingest-geoip from elastic  
[=====] 100%  
@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@  
@ WARNING: plugin requires additional permissions @  
@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@  
* java.lang.RuntimePermission accessDeclaredMembers  
* java.lang.reflect.ReflectPermission suppressAccessChecks  
See http://docs.oracle.com/javase/8/docs/technotes/guides/security/permissions.html  
for descriptions of what these permissions allow and the associated risks.  
  
Continue with installation? [y/N]y  
-> Installed ingest-geoip
```

Plugins from custom link or filesystem can be installed as follow:

```
cd /usr/share/elasticsearch/  
sudo bin/elasticsearch-plugin install [url]
```

Example:

```
sudo bin/elasticsearch-plugin install file:///path/to/plugin.zip  
bin\elasticsearch-plugin install file:///C:/path/to/plugin.zip  
sudo bin/elasticsearch-plugin install http://some.domain/path/to/plugin.zip
```

3.8.2 Listing plugins

Listing currently loaded plugins

```
sudo bin/elasticsearch-plugin list
```

listing currently available core plugins:

```
sudo bin/elasticsearch-plugin list --help
```

3.8.3 Removing plugins

```
sudo bin/elasticsearch-plugin remove [pluginname]
```

3.8.4 Updating plugins

```
sudo bin/elasticsearch-plugin remove [pluginname]
sudo bin/elasticsearch-plugin install [pluginname]
```

3.9 ROOTless management

To configure Energy Logserver so its services can be managed without root access follow these steps:

1. Create a file in `/etc/sudoers.d` (eg.: `10-logserver`) with the content

```
%kibana ALL=/bin/systemctl status kibana %kibana ALL=/bin/systemctl status kibana.service
%kibana ALL=/bin/systemctl stop kibana %kibana ALL=/bin/systemctl stop kibana.service %kibana
ALL=/bin/systemctl start kibana %kibana ALL=/bin/systemctl start kibana.service %kibana
ALL=/bin/systemctl restart kibana %kibana ALL=/bin/systemctl restart kibana.service
```

```
%elasticsearch ALL=/bin/systemctl status elasticsearch
%elasticsearch ALL=/bin/systemctl status elasticsearch.service
%elasticsearch ALL=/bin/systemctl stop elasticsearch
%elasticsearch ALL=/bin/systemctl stop elasticsearch.service
%elasticsearch ALL=/bin/systemctl start elasticsearch
%elasticsearch ALL=/bin/systemctl start elasticsearch.service
%elasticsearch ALL=/bin/systemctl restart elasticsearch
%elasticsearch ALL=/bin/systemctl restart elasticsearch.service

%alert ALL=/bin/systemctl status alert
%alert ALL=/bin/systemctl status alert.service
%alert ALL=/bin/systemctl stop alert
%alert ALL=/bin/systemctl stop alert.service
%alert ALL=/bin/systemctl start alert
%alert ALL=/bin/systemctl start alert.service
%alert ALL=/bin/systemctl restart alert
%alert ALL=/bin/systemctl restart alert.service

%logstash ALL=/bin/systemctl status logstash
%logstash ALL=/bin/systemctl status logstash.service
%logstash ALL=/bin/systemctl stop logstash
%logstash ALL=/bin/systemctl stop logstash.service
%logstash ALL=/bin/systemctl start logstash
%logstash ALL=/bin/systemctl start logstash.service
%logstash ALL=/bin/systemctl restart logstash
%logstash ALL=/bin/systemctl restart logstash.service
```

2. Change permissions for files and directories

- Kibana, Elasticsearch, Alert

```
chmod g+rw /etc/kibana/kibana.yml /opt/alert/config.yaml /opt/ai/bin/conf.cfg /
↪etc/elasticsearch/{elasticsearch.yml,jvm.options,log4j2.properties,properties.
↪yaml,role-mappings.yml}
chmod g+rxw /etc/kibana/ssl /etc/elasticsearch/ /opt/{ai,alert} /opt/ai/bin
chown -R elasticsearch:elasticsearch /etc/elasticsearch/
chown -R kibana:kibana /etc/kibana/ssl
```

- Logstash

```
find /etc/logstash -type f -exec chmod g+rw {} \;
find /etc/logstash -type d -exec chmod g+rxw {} \;
chown -R logstash:logstash /etc/logstash
```

1. Add a user to groups defined earlier

```
usermod -a -G kibana,alert,elasticsearch,logstash service_user
```

From now on this user should be able to start/stop/restart services and modify configurations files.

3.10 Energy Logserver Elasticsearch encryption

3.10.1 Generating Certificates

1. Requirements for certificate configuration:

- **To encrypt traffic (HTTP and transport layer) of Elasticsearch you have to generate certificate authority which will be used to sign each node certificate of a cluster.**
- **Elasticsearch certificate has to be generated in pkcs8 RSA format.**

1. Example certificate configuration (Certificates will be valid for 10 years based on this example):

```
# To make this process easier prepare some variables:
DOMAIN=loganalytics-node.test
DOMAIN_IP=10.4.3.185 # This is required if certificate validation is used on trasport,
↪layer
COUNTRYNAME=PL
STATE=Poland
COMPANY=LOGTEST

# Generate CA key:
openssl genrsa -out rootCA.key 4096

# Create and sign root certificate:
echo -e "${COUNTRYNAME}\n${STATE}\n\n${COMPANY}\n\n\n" | openssl req -x509 -new -
↪nodes -key rootCA.key -sha256 -days 3650 -out rootCA.crt

# Crete RSA key for domain:
openssl genrsa -out ${DOMAIN}.pre 2048

# Convert generated key to pkcs8 RSA key for domain hostname
# (if you do not want to encrypt the key add "-nocrypt" at the end of the command;
↪otherwise it will be necessary to add this password later in every config file):
```

(continues on next page)

(continued from previous page)

```

openssl pkcs8 -topk8 -inform pem -in ${DOMAIN}.pre -outform pem -out ${DOMAIN}.key

# Create a Certificate Signing Request (openssl.cnf can be in a different location;
↪this is the default for CentOS 7.7):
openssl req -new -sha256 -key ${DOMAIN}.key -subj "/C=PL/ST=Poland/O=EMCA/CN=${DOMAIN}
↪" -reqexts SAN -config <(cat /etc/pki/tls/openssl.cnf <(printf
↪"[SAN]\nsubjectAltName=DNS:${DOMAIN},IP:${DOMAIN_IP}") -out ${DOMAIN}.csr

# Generate Domain Certificate
openssl x509 -req -in ${DOMAIN}.csr -CA rootCA.crt -CAkey rootCA.key -CAcreateserial -
↪out ${DOMAIN}.crt -sha256 -extfile <(printf "[req]\ndefault_
↪bits=2048\ndistinguished_name=req_distinguished_name\nreq_extensions=req_ext\n[req_
↪distinguished_name]\ncountryName=${COUNTRYNAME}\nstateOrProvinceName=${STATE}
↪\norganizationName=${COMPANY}\ncommonName=${DOMAIN}\n[req_ext]\nsubjectAltName=@alt_
↪names\n[alt_names]\nDNS.1=${DOMAIN}\nIP=${DOMAIN_IP}\n") -days 3650 -extensions req_
↪ext

# Verify the validity of the generated certificate
openssl x509 -in ${DOMAIN}.crt -text -noout

```

1. Right now you should have these files:

```

$ ls -l | sort
loganalytics-node.test.crt
loganalytics-node.test.csr
loganalytics-node.test.key
loganalytics-node.test.pre
rootCA.crt
rootCA.key
rootCA.srl

```

1. Create a directory to store required files (users: elasticsearch, kibana and logstash have to be able to read these files):

```

mkdir /etc/elasticsearch/ssl
cp {loganalytics-node.test.crt,loganalytics-node.test.key,rootCA.crt} /etc/
↪elasticsearch/ssl
chown -R elasticsearch:elasticsearch /etc/elasticsearch/ssl
chmod 755 /etc/elasticsearch/ssl
chmod 644 /etc/elasticsearch/ssl/*

```

3.10.2 Setting up configuration files

1. Append or uncomment below lines in /etc/elasticsearch/elasticsearch.yml and change paths to proper values (based on past steps): ““yaml

3.11 Transport layer encryption

```

logserverguard.ssl.transport.enabled: true logserverguard.ssl.transport.pemcert_filepath:
"/etc/elasticsearch/ssl/loganalytics-node.test.crt" logserverguard.ssl.transport.pemkey_filepath:
"/etc/elasticsearch/ssl/loganalytics-node.test.key" logserverguard.ssl.transport.pemkey_password: "pass-
word_for_pemkey" # if there is no password leve "" logserverguard.ssl.transport.pemtrustedcas_filepath:
"/etc/elasticsearch/ssl/rootCA.crt"

```

logserverguard.ssl.transport.enforce_hostname_verification: true logserverguard.ssl.transport.resolve_hostname: true

logserverguard.ssl.transport.enabled_ciphers:

- “TLS_DHE_RSA_WITH_AES_256_GCM_SHA384” logserverguard.ssl.transport.enabled_protocols:
- “TLSv1.2”

3.12 HTTP layer encryption

logserverguard.ssl.http.enabled: true logserverguard.ssl.http.pemcert_filepath: “/etc/elasticsearch/ssl/loganalytics-node.test.crt” logserverguard.ssl.http.pemkey_filepath: “/etc/elasticsearch/ssl/loganalytics-node.test.key” logserverguard.ssl.http.pemkey_password: “password_for_pemkey” # if there is no password leave “” logserverguard.ssl.http.pemtrustedcas_filepath: “/etc/elasticsearch/ssl/rootCA.crt”

logserverguard.ssl.http.clientauth_mode: OPTIONAL logserverguard.ssl.http.enabled_ciphers:

- “TLS_DHE_RSA_WITH_AES_256_GCM_SHA384”

logserverguard.ssl.http.enabled_protocols:

- “TLSv1.2”

2. Append or uncomment below lines in ``/etc/kibana/kibana.yml`` and change paths to proper values:

```
```yaml
For below two, both IP or HOSTNAME (https://loganalytics-node.test:PORT) can be
used because IP has been supplied in "alt_names"
elasticsearch.url: "https://10.4.3.185:8000" # Default is "http://localhost:8000"

elastfilter.url: "https://10.4.3.185:9200" # Default is "http://localhost:9200"

Elasticsearch traffic encryption
There is also an option to use "127.0.0.1/localhost" and to not supply path to CA.
Verification Mode should be then changed to "none".
elasticsearch.ssl.verificationMode: full
elasticsearch.ssl.certificate: "/etc/elasticsearch/ssl/loganalytics-node.test.crt"
elasticsearch.ssl.key: "/etc/elasticsearch/ssl/loganalytics-node.test.key"
elasticsearch.ssl.keyPassphrase: "password_for_pemkey" # this line is not required if
there is no password
elasticsearch.ssl.certificateAuthorities: "/etc/elasticsearch/ssl/rootCA.crt"
```

1. Append or uncomment below lines in `/opt/alert/config.yaml` and change paths to proper values:

```
Connect with TLS to Elasticsearch
use_ssl: True

Verify TLS certificates
verify_certs: True

Client certificate:
client_cert: /etc/elasticsearch/ssl/loganalytics-node.test.crt
client_key: /etc/elasticsearch/ssl/loganalytics-node.test.key
ca_certs: /etc/elasticsearch/ssl/rootCA.crt
```

1. For CSV/HTML export to work properly rootCA.crt generated in first step has to be “installed” on the server.  
Below example for CentOS 7:

```
Copy rootCA.crt and update CA trust store
cp /etc/elasticsearch/ssl/rootCA.crt /etc/pki/ca-trust/source/anchors/rootCA.crt
update-ca-trust
```

#### 1. Intelligence module. Generate pkcs12 keystore/cert:

```
DOMAIN=loganalytics-node.test
keytool -import -file /etc/elasticsearch/ssl/rootCA.crt -alias root -keystore root.jks
openssl pkcs12 -export -in /etc/elasticsearch/ssl/${DOMAIN}.crt -inkey /etc/
↪elasticsearch/ssl/${DOMAIN}.key -out ${DOMAIN}.p12 -name "${DOMAIN}" -certfile /etc/
↪elasticsearch/ssl/rootCA.crt
```

```
Configure /opt/ai/bin/conf.cfg
https_keystore=/path/to/pk12/loganalytics-node.test.p12
https_truststore=/path/to/root.jks
https_keystore_pass=bla123
https_truststore_pass=bla123
```

### 3.12.1 Logstash/Beats

You can either install CA to allow Logstash and Beats traffic or you can supply required certificates in config:

#### 1. Logstash:

```
output {
 elasticsearch {
 hosts => "https://loganalytics-node.test:9200"
 ssl => true
 index => "winlogbeat-%{+YYYY.MM}"
 user => "logstash"
 password => "logstash"
 cacert => "/path/to/cacert/rootCA.crt"
 }
}
```

#### 1. Beats:

```
output.elasticsearch.hosts: ["https://loganalytics-node.test:9200"]
output.elasticsearch.protocol: "https"
output.elasticsearch.ssl.enabled: true
output.elasticsearch.ssl.certificate_authorities: ["/path/to/cacert/rootCA.crt"]
```

Additionally, for any beats program to be able to write to elasticsearch, you will have to make changes to “enabled\_ciphers” directive in “/etc/elasticsearch/elasticsearch.yml”. This is done by commenting:

```
logserverguard.ssl.http.enabled_ciphers:
- "TLS_DHE_RSA_WITH_AES_256_GCM_SHA384"
```

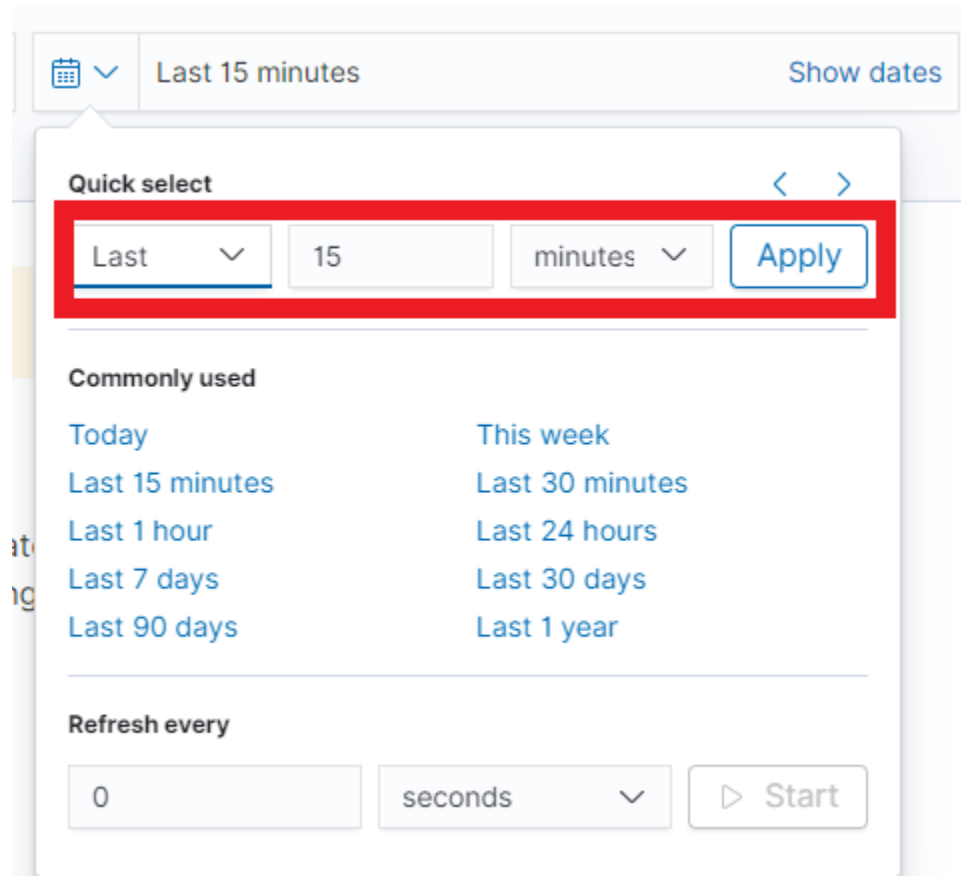

Otherwise, the beat will not be able to send documents directly and if you want to avoid it you can send a document with Logstash first.

#### 4.1 Time settings and refresh

In the upper right corner there is a section in which it defines the range of time that Energy Logserver will search in terms of conditions contained in the search bar. The default value is the last 15 minutes.

After clicking this selection, we can adjust the scope of search by selecting one of the three tabs in the drop-down window:

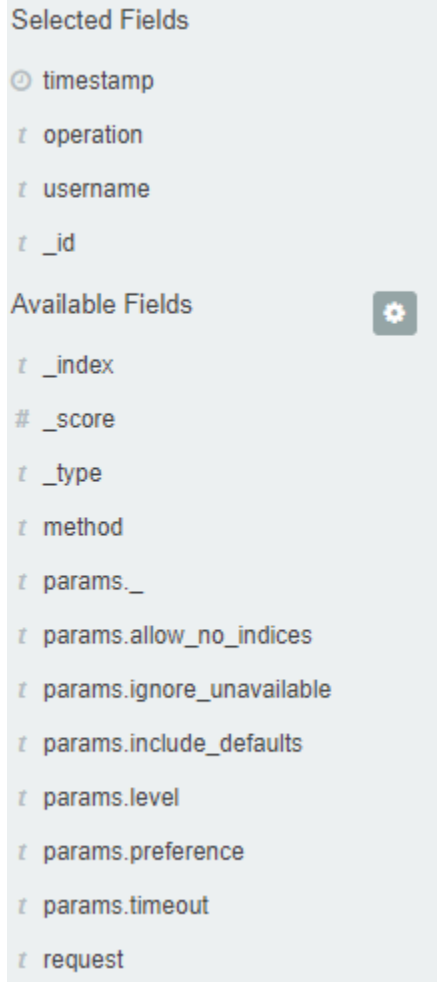

- **Quick:** contain several predefined ranges that should be clicked.
- **Relative:** in this windows specify the day from which Energy Logserver should search for data.
- **Absolute:** using two calendars we define the time range for which the search results are to be returned.

## 4.2 Fields

Energy Logserver in the body of searched events, it recognize fields that can be used to created more precision queries. The extracted fields are visible in the left panel. They are divided on three types: timestamp, marked on clock icon  `timestamp`; text, marked with the letter “t”  `params.level` and digital, marked witch hashtag  `_score`.

Pointing to them and clicking on icon , they are automatically transferred to the „Selected Fields” column and in the place of events a table with selected columns is created on regular basis. In the “Selected Fields” selection you can also delete specific fields from the table by clicking  on the selected element.

## 4.3 Filtering and syntax building

We use the query bar to search interesting events. For example, after entering the word „error”, all events that contain the word will be displayed, additionally highlighting them with a yellow background.

### 4.3.1 Syntax

Fields can be used in the similar way by defining conditions that interesting us. The syntax of such queries is:

```
<fields_name:<fields_value>
```

Example:

```
status:500
```

This query will display all events that contain the „status” fields with a value of 500.

### 4.3.2 Filters

The field value does not have to be a single, specific value. For digital fields we can specify range in the following scheme:

```
<fields_name:[<range_from TO <range_to]
```

Example:

```
status:[500 TO 599]
```

This query will return events with status fields that are in the range 500 to 599.

### 4.3.3 Operators

The search language used in Energy Logserver allows to you use logical operators „AND”, „OR” and „NOT”, which are key and necessary to build more complex queries.

- **AND** is used to combined expressions, e.g. „error AND „access denied”. If an event contain only one expression or the words error and denied but not the word access, then it will not be displayed.
- **OR** is used to search for the events that contain one OR other expression, e.g. „status:500” OR “denied”. This query will display events that contain word „denied” or status field value of 500. Energy Logserver uses this operator by default, so query „status:500” “denied” would return the same results.
- **NOT** is used to exclude the following expression e.g. „status:[500 TO 599] NOT status:505” will display all events that have a status fields, and the value of the field is between 500 and 599 but will eliminate from the result events whose status field value is exactly 505.
- **The above methods** can be combined with each other by building even more complex queries. Understanding how they work and joining it, is the basis for effective searching and full use of Energy Logserver.

Example of query built from connected logical operations:

```
status:[500 TO 599] AND („access denied" OR error) NOT status:505
```

Returns in the results all events for which the value of status fields are in the range of 500 to 599, simultaneously contain the word „access denied” or „error”, omitting those events for which the status field value is 505.

## 4.4 Saving and deleting queries

Saving queries enables you to reload and use them in the future.

### 4.4.1 Save query

To save query, click on the “Save” button under on the query bar:

New Save Open Share

Save

This will bring up a window in which we give the query a name and then click the button

Save search

×

Title

New Saved Search

Cancel

Confirm Save

Saved queries can be opened by going to „Open” from the main menu at the top of the page, and select saved search from the search list:

Open search ×

Additional you can use “Saved Searchers Filter..” to filter the search list.

#### 4.4.2 Open query

To open a saved query from the search list, you can click on the name of the query you are interested in.

After clicking on the icon  **Edit filter** on the name of the saved query and chose “Edit Query DSL”, we will gain access to the advanced editing mode, so that we can change the query on at a lower level.

 **Edit filter**

It is a powerful tool designed for advanced users, designed to modify the query and the way it is presented by Energy Logserver.

#### 4.4.3 Delete query

To delete a saved query, open it from the search list, and then click on the button  **Delete**.

If you want delete many saved queries simultaneously go to the “Management Object” -> “Saved Object” -> “Searches” select it in the list (the icon  to the left of the query name), and then click “Delete” button.

Management / Saved objects Logout ⓘ

**Kibana**

- Index Patterns
- Saved Objects**
- Advanced Settings

**Saved Objects** Export 314 objects Import Refresh

From here you can delete saved objects, such as saved searches. You can also edit the raw data of saved objects. Typically objects are only modified via their associated application, which is probably what you should use instead of this screen.

Search... Type ▾ **Delete** Export ▾

**Export** ▾

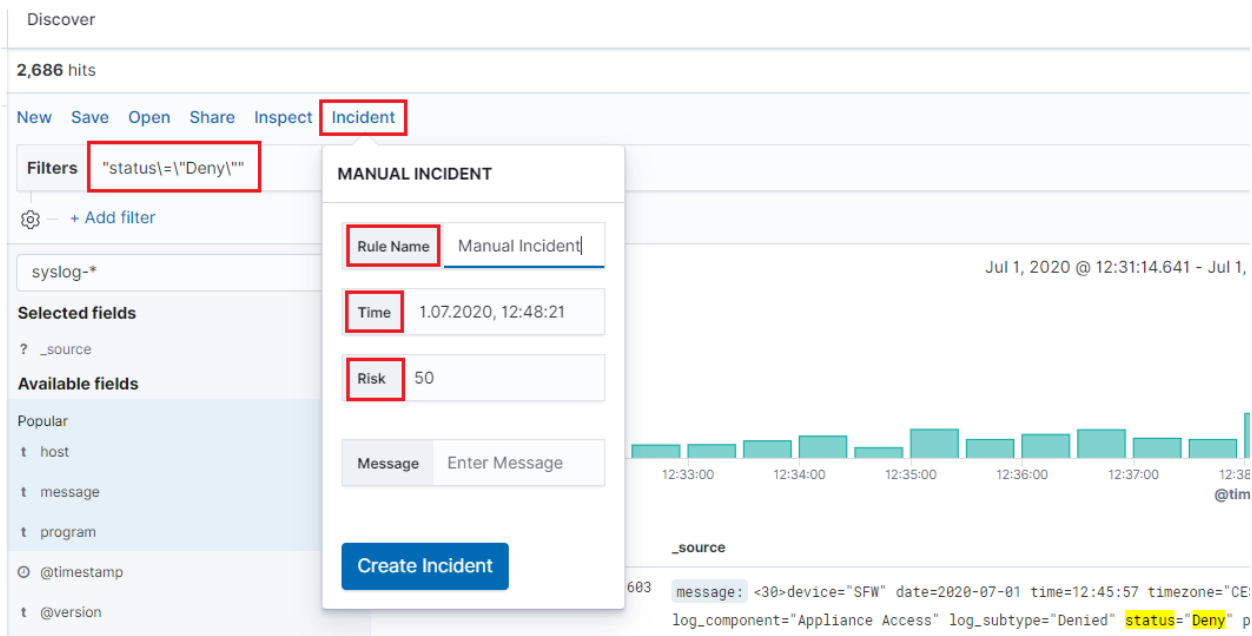

From this level, you can also export saved queries in the same way. To do this, you need to click on

and choose the save location. The file will be saved in .JSON format. If you then want to import such a file to Energy Logserver, click on button  **Import**, at the top of the page and select the desired file.

## 4.5 Manual incident

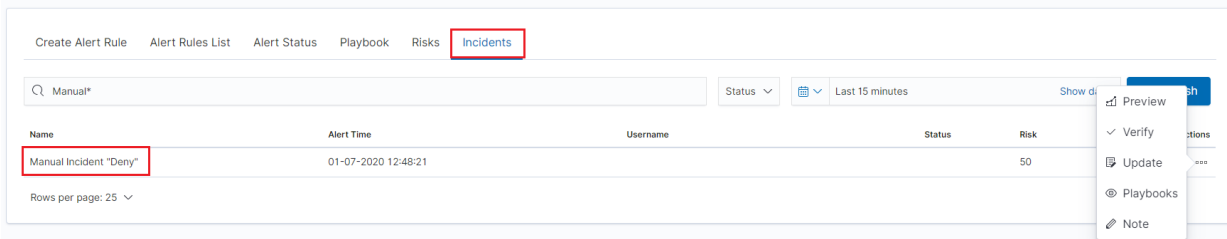

The `Discovery` module allows you to manually create incidents that are saved in the `Incidents` tab of the `Alerts` module. Manual incidents are based on search results or filtering. For a manual incident, you can save the following parameters:

- Rule name
- Time
- Risk
- Message

The screenshot shows the 'Discover' module interface. At the top, it says 'Discover' and '2,686 hits'. Below this are buttons: 'New', 'Save', 'Open', 'Share', 'Inspect', and 'Incident' (which is highlighted with a red box). To the left is a 'Filters' section with a search bar containing 'status=\"Deny\"' (also highlighted with a red box). Below the filters is a 'Selected fields' section with a search bar containing 'syslog-\*'. To the right of the filters is a 'MANUAL INCIDENT' dialog box. This dialog has four fields: 'Rule Name' (containing 'Manual Incident'), 'Time' (containing '1.07.2020, 12:48:21'), 'Risk' (containing '50'), and 'Message' (containing 'Enter Message'). Each of these four fields is highlighted with a red box. At the bottom of the dialog is a blue 'Create Incident' button. In the background, a log entry is visible with the field 'status=Deny' highlighted in yellow.

After saving the manual incident, you can go to the `Incident` tab in the `Alert` module to perform the incident handling procedure.

The screenshot shows the 'Alerts' module interface. At the top, there are tabs: 'Create Alert Rule', 'Alert Rules List', 'Alert Status', 'Playbook', 'Risks', and 'Incidents' (which is highlighted with a red box). Below the tabs is a search bar containing 'Manual\*'. To the right of the search bar are buttons for 'Status' (a dropdown menu), 'Last 15 minutes' (a calendar icon), and 'Show details' (a plus icon). Below these is a table with the following columns: 'Name', 'Alert Time', 'Username', 'Status', and 'Risk'. The first row of the table is 'Manual Incident \"Deny\"', which is highlighted with a red box. To the right of the table is a context menu with the following options: 'Preview', 'Verify', 'Update', 'Playbooks', and 'Note'.

Visualize enables you to create visualizations of the data in your Energy Logserver indices. You can then build dashboards that display related visualizations. Visualizations are based on Energy Logserver queries. By using a series of Energy Logserver aggregations to extract and process your data, you can create charts that show you the trends, spikes, and dips.

## 5.1 Creating visualization

### 5.1.1 Create

To create visualization, go to the „Visualize” tab from the main menu. A new page will be appearing where you can create or load visualization.

### 5.1.2 Load

To load previously created and saved visualization, you must select it from the list.

The screenshot shows the 'Visualizations' page in the Energy-Log-Server-7.x interface. The left sidebar contains a menu with items: Recently viewed, Discover, Visualize (highlighted), Dashboard, XLSX Import, Cluster, Wazuh, LogTrail, Agents, Alerts, Intelligence, Scheduler, Reports, Config, Dev Tools, and Management. The main panel is titled 'Visualizations' and features a search bar. A table lists various visualizations, each with a checkbox, title, type, and actions. The first two items, 'AD Account - Name Changed' and 'AD DNS Chagnes Pie', are highlighted with a red box. A blue button labeled 'Create new visualization' is located in the top right corner of the main panel.

<input type="checkbox"/>	Title	Type	Actions
<input type="checkbox"/>	AD Account - Name Changed	Metric	
<input type="checkbox"/>	AD DNS Chagnes Pie	Pie	
<input type="checkbox"/>	AD DNS Changes Count	Metric	
<input type="checkbox"/>	AD GROUP - Changed	Metric	
<input type="checkbox"/>	AD LoginLogout	Line	
<input type="checkbox"/>	AD LoginLogout Ratio	Pie	
<input type="checkbox"/>	AD Security Group - Changed vis	Metric	
<input type="checkbox"/>	AD Security Group - Created vis	Metric	
<input type="checkbox"/>	AD Security Group - Deleted vis	Metric	
<input type="checkbox"/>	Alert - Documents TOP hits	Pie	

Rows per page: 10

< 1 2 3 4 5 ... 20 >

In order to create a new visualization, you should choose the preferred method of data presentation.

## New Visualization

### Select a visualization type

Start creating your visualization by selecting a type for that visualization.

  
Area

  
Controls

  
Coordinate Map

  
Data Table

  
Gauge

  
Goal

  
Heat Map

  
Horizontal Bar

  
Line

  
Markdown

  
Metric

  
Network

  
Pie

  
Region Map

  
TSVB

  
Tag Cloud

  
Timelion

  
Vega

  
Vertical Bar

Next, specify whether the created visualization will be based on a new or previously saved query. If on new one, select the index whose visualization should concern. If visualization is created from a saved query, you just need to select the appropriate query from the list, or (if there are many saved searches) search for them by name.

## New Area / Choose a source

✕

Sort ▾
Types 2 ▾

Saved search
Index pattern

< 1 2 3 4 5 ... 11 >

## 5.2 Vizualization types

Before the data visualization will be created, first you have to choose the presentation method from an existing list. Currently there are five groups of visualization types. Each of them serves different purposes. If you want to see only the current number of products sold, it is best to choose „Metric”, which presents one value.

**36**  
Count

However, if we would like to see user activity trends on pages in different hour and days, a better choice will be „Area chart”, which displays a chart with time division.

The „Markdown widget” views is used to place text e.g. information about the dashboard, explanations and instruction on how to navigate. Markdown language was used to format the text (the most popular use is GitHub). More information and instruction can be found at this link: <https://help.github.com/categories/writing-on-github/>

## 5.3 Edit visualization and saving

### 5.3.1 Edititing

Editing a saved visualization enables you to directly modify the object definition. You can change the object title, add a description, and modify the JSON that defines the object properties. After selecting the index and the method of data presentation, you can enter the editing mode. This will open a new window with empty visualization.

At the very top there is a bar of queries that can be edited throughout the creation of the visualization. It works in the same way as in the “Discover” tab, which means searching the raw data, but instead of the data being displayed, the visualization will be edited. The following example will be based on the „Area chart”. The visualization modification panel on the left is divided into three tabs: „Data”, “Metric & Axes” and „Panel Settings”.

In the „Data” tab, you can modify the elements responsible for which data and how should be presented. In this tab there are two sectors: “metrics”, in which we set what data should be displayed, and „buckets” in which we specify how they should be presented.

Select the Metrics & Axes tab to change the way each individual metric is shown on the chart. The data series are styled in the Metrics section, while the axes are styled in the X and Y axis sections.

In the „Panel Settings” tab, there are settings relating mainly to visual aesthetics. Each type of visualization has separate options.

To create the first graph in the chart modification panel, in the „Data” tab we add X-Axis in the “buckets” sections. In „Aggregation” choose „Histogram”, in „Field” should automatically be located “timestamp” and “interval”: “Auto” (if not, this is how we set it). Click on the icon on the panel. Now our first graph should show up.

Some of the options for „Area Chart” are:

**Smooth Lines** - is used to smooth the graph line.

- **Current time marker** – places a vertical line on the graph that determines the current time.
- **Set Y-Axis Extents** – allows you to set minimum and maximum values for the Y axis, which increases the readability of the graphs. This is useful, if we know that the data will never be less then (the minimum value), or to indicate the goals the company (maximum value).
- **Show Tooltip** – option for displaying the information window under the mouse cursor, after pointing to the point on the graph.

### 5.3.2 Saving

To save the visualization, click on the “Save” button under on the query bar:

New Save Open Share

give it a name and click the button

Save

### 5.3.3 Load

To load the visualization, go to the “Management Object” -> “Saved Object” -> “Visualizations” select it from the list. From this place, we can also go into advanced editing mode. To view of the visualization use

 View visualization

button.

## 5.4 Dashboards

Dashboard is a collection of several visualizations or searches. Depending on how it is build and what visualization it contains, it can be designed for different teams e.g.:

- SOC - which is responsible for detecting failures or threats in the company;
- business - which thanks to the listings can determine the popularity of products and define the strategy of future sales and promotions;
- managers and directors - who may immediately have access to information about the performance units or branches.

### 5.4.1 Create

To create a dashboard from previously saved visualization and queries, go to the „Dashboard” tab in the main menu. When you open it, a new page will appear.

Clicking on the icon “Add” at the top of page select “Visualization” or “Saved Search” tab.

and selecting a saved query and / or visualization from the list will add them to the dashboard. If, there are a large number of saved objects, use the bar to search for them by name.

Elements of the dashboard can be enlarged arbitrarily (by clicking on the right bottom corner of object and dragging the border) and moving (by clicking on the title bar of the object and moving it).

### 5.4.2 Saving

You may change the time period of your dashboard.

At the upper right hand corner, you may choose the time range of your dashboard.

Click save and choose the ‘Store time with dashboard’ if you are editing an existing dashboard. Otherwise, you may choose ‘Save as a new dashboard’ to create a new dashboard with the new time range.

To save a dashboard, click on the “Save” button to the top of the query bar and give it a name.

### 5.4.3 Load

To load the Dashboard, go to the “Management Object” -> “Saved Object” -> “Dashborad” select it from the list. From this place, we can also go into advanced editing mode. To view of the visualization use  View dashboard button.

## 5.5 Sharing dashboards

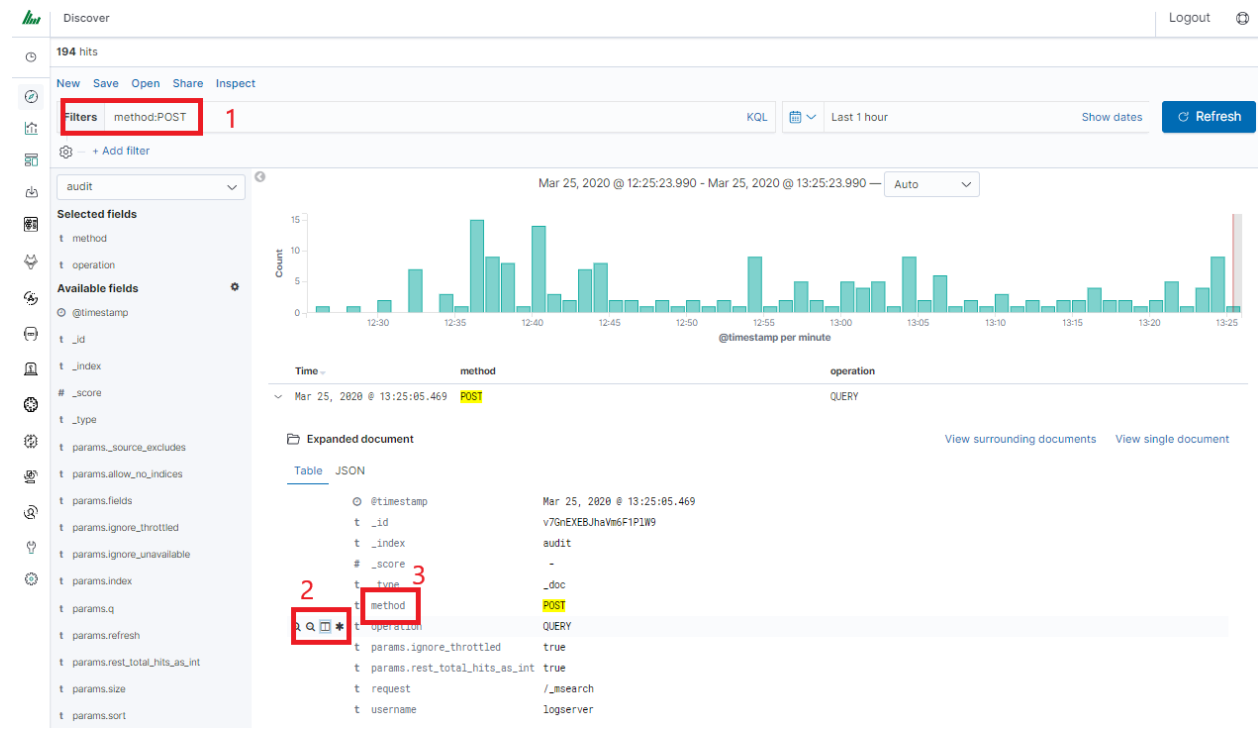

The dashboard can be share with other Energy Logserver users as well as on any page - by placing a snippet of code. Provided that it cans retrieve information from Energy Logserver.

To do this, create new dashboard or open the saved dashboard and click on the “Share” to the top of the page. A window will appear with generated two URL. The content of the first one “Embaded iframe” is used to provide the dashboard in the page code, and the second “Link” is a link that can be passed on to another user. There are two option for each, the first is to shorten the length of the link, and second on copies to clipboard the contest of the given bar.

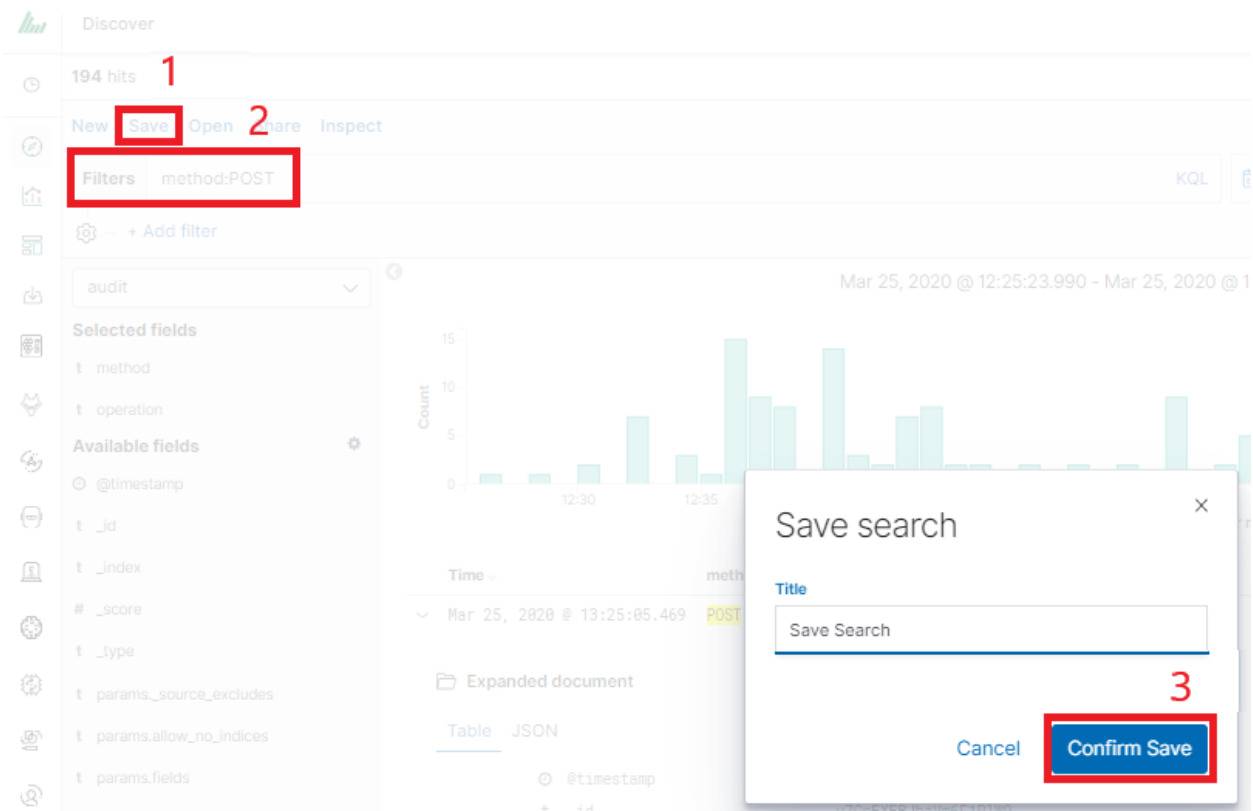

## 5.6 Dashboard drilldown

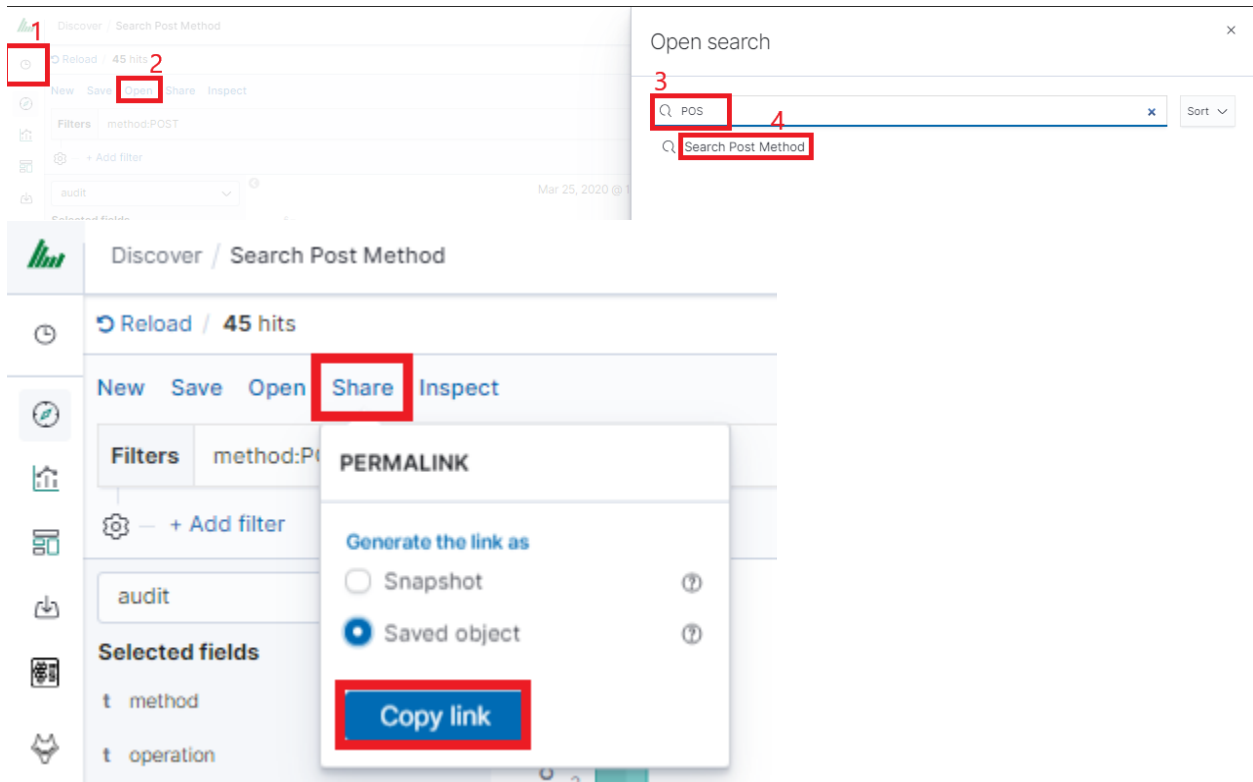

In discovery tab search for message of Your interest

Save Your search

Check You „Shared link” and copy it

**! ATTENTION !** Do not copy „?\_g=()” at the end.

## Select Alerting module

Once Alert is created use ANY frame to add the following directives:

```
Use_kibana4_dashboard: paste Your „shared link” here
```

`use_kibana_dashboard`: - The name of a Kibana dashboard to link to. Instead of generating a dashboard from a template, Alert can use an existing dashboard. It will set the time range on the dashboard to around the match time, upload it as a temporary dashboard, add a filter to the `query_key` of the alert if applicable, and put the url to the dashboard in the alert. (Optional, string, no default).

```
Kibana4_start_timedelta
```

`kibana4_start_timedelta`: Defaults to 10 minutes. This option allows you to specify the start time for the generated kibana4 dashboard. This value is added in front of the event. For example,

```
`kibana4_start_timedelta: minutes: 2`
```

```
Kibana4_end_timedelta`
```

kibana4\_end\_timedelta: Defaults to 10 minutes. This option allows you to specify the end time for the generated kibana4 dashboard. This value is added in back of the event. For example,

```
kibana4_end_timedelta: minutes: 2
```

**Type**  
Any

**Description**  
The any rule will match everything. Every hit that the query returns will generate an alert.

**Example**

```

_type: ash
- term:
 outcome: failure

(Optional, change specific)
#sum_events: 10
#timeframe:
hours: 1
#query_key: username

```

**Alert method**  
None

**Any**

```

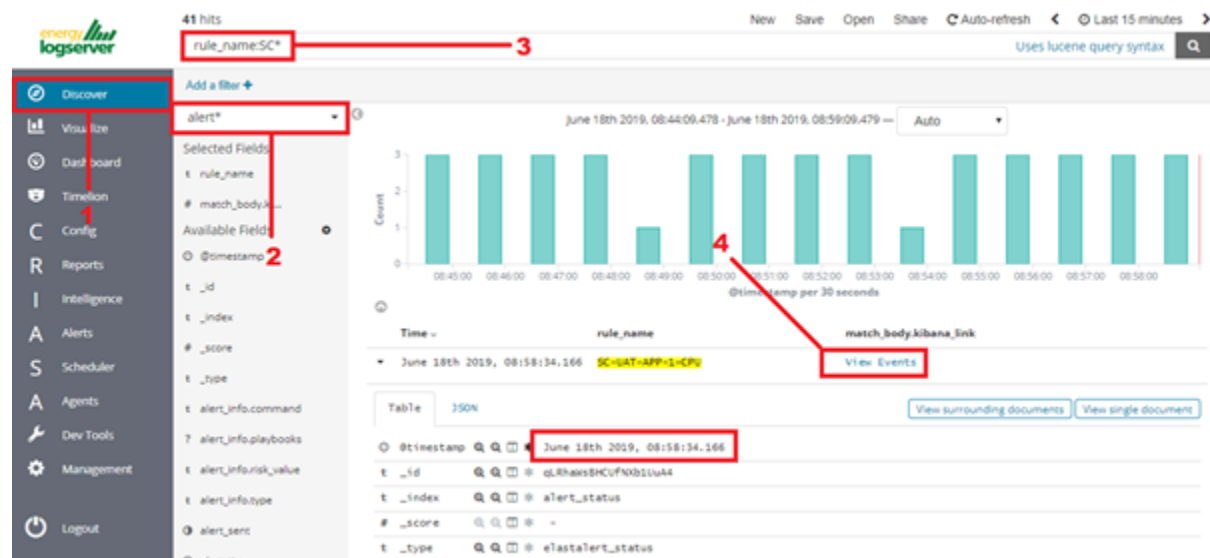

filter:
- query_string:
 query: "system.process.cpu.total.pct:*"

use_kibana4_dashboard: "https://Energy-Logserver:5601/app/kibana#/discover/26903a60-9123-11e9-bc05-b11f06f8053d"
kibana4_start_timedelta:
minutes: 10
kibana4_end_timedelta:
minutes: 0

```

Sample:

Search for triggered alert in Discovery tab. Use alert\* search pattern.

Refresh the alert that should contain url for the dashboard. Once available, kibana\_dashboard field can be exposed to dashboards giving You a real drill down feature.

## CHAPTER 6

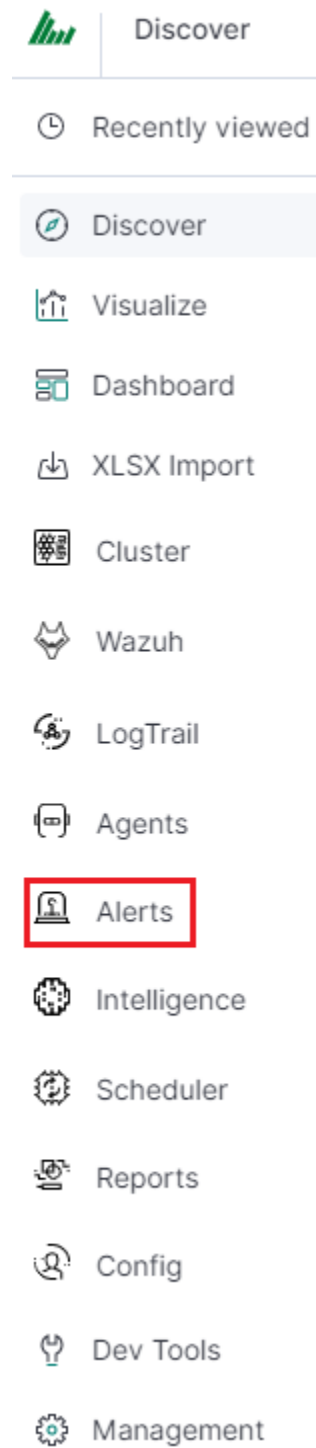

---

### Reports

---

Energy Logserver contains a module for creating reports that can be run cyclically and contain only interesting data, e.g. a weekly sales report.

To go to the reports windows, select to tiles icon from the main menu bar, and then go to the „Reports” icon (To go back, go to the „Search” icon).

## 6.1 CSV Report

To export data to CSV Report click the Reports icon, you immediately go to the first tab - Export Task Management.

05-00-00-Reports/./media/media/image39\_js.png

In this tab we have the opportunity to specify the source from which we want to do export. It can be an index pattern. After selecting it, we confirm the selection with the Submit button and a report is created at the moment. The symbol

can refresh the list of reports and see what its status is.

### User roles and object management

---

#### 7.1 Users, roles and settings

Energy Logserver allows to you manage users and permission for indexes and methods used by them. To do this click the “Config” button from the main menu bar.

A new window will appear with three main tabs: „User Management”, „Settings” and „License Info”.

From the „User Management” level we have access to the following possibilities: Creating a user in „Create User”, displaying users in „User List”, creating new roles in „Create roles” and displaying existing roles in „List Role”.

## 7.2 Creating a User (Create User)

### 7.2.1 Creating user

To create a new user click on the Config icon and you immediately enter the administration panel, where the first tab is to create a new user (**Create User**).

The screenshot shows the 'Create User' form in the administration panel. At the top, there are tabs: 'User Management' (selected), 'Settings', and 'License Info'. Below these, there are sub-tabs: 'Create User' (selected), 'User List', 'Create Role', 'Role List', and 'Objects Permission'. The form itself has three input fields: 'Username', 'Password' (with a lock icon), and 'Email'. Below the 'Email' field is a 'Roles' section. It features a search bar with 'admin' and 'kibana' selected, and a dropdown list showing 'alert', 'intelligence', 'logstash', and 'security'. A 'Submit' button is located at the bottom of the form.

In the wizard that opens, we enter a unique username (Username field), password for the user (field Password) and assign a role (field Role). In this field we have the option of assigning more than one role. Until we select role in the Roles field, the Default Role field remains empty. When we mark several roles, these roles appear in the Default Role field. In this field we have the opportunity to indicate which role for a new user will be the default role with which the user will be associated in the first place when logging in. The default role field has one more important task - it binds all users with the field / role set in one group. When one of the users of this group create Visualization or Dashboard it will be available to other users from this role(group). Creating the account is confirmed with the Submit button.

### 7.2.2 User's modification and deletion, (User List)

Once we have created users, we can display their list. We do it in next tab (**User List**).

The screenshot shows a web application interface for user management. In the background, there is a 'User Management' page with a table of users and their roles. Overlaid on this is a modal dialog titled 'Update User : logstash'. The dialog has several input fields: 'New Password' (with a lock icon), 'Re-enter New Password', 'Email', 'Roles' (a dropdown menu currently showing 'logstash'), and 'Default Role' (a dropdown menu). At the bottom right of the dialog are 'Cancel' and 'Save' buttons.

Username	Roles
alert	admin
intelligence	admin
logserver	admin
logstash	logstash
scheduler	admin

In this view, we get a list of user account with assigned roles and we have two buttons: Delete and Update. The first of these is ability to delete a user account. Under the Update button is a drop-down menu in which we can change the previous password to a new one (New password), change the password (Re-enter Ne Password), change the previously assigned roles (Roles), to other (we can take the role assigned earlier and give a new one, extend user permissions with new roles). The introduced changes are confirmed with the Submit button.

We can also see current user setting and clicking the Update button collapses the previously expanded menu.

### 7.3 Create, modify and delete a role (Create Role), (Role List)

In the Create Role tab we can define a new role with permissions that we assign to a pattern or several index patterns.

[User Management](#)[Settings](#)[License Info](#)[Create User](#)[User List](#)[Create Role](#)[Role List](#)[Objects Permission](#)**Role Name****Paths****Methods**  

---

get

post

put

delete

head

In example, we use the syslog2\* index pattern. We give this name in the Paths field. We can provide one or more index patterns, their names should be separated by a comma. In the next Methods field, we select one or many methods that will be assigned to the role. Available methods:

- PUT - sends data to the server
- POST - sends a request to the server for a change
- DELETE - deletes the index / document
- GET - gets information about the index /document
- HEAD - is used to check if the index /document exists

In the role field, enter the unique name of the role. We confirm addition of a new role with the Submit button. To see if a new role has been added, go to the net Role List tab.

User Management				Settings	License Info
Create User				User List	Create Role
				Role List	Objects Permission
Role Name	Methods	Paths	Actions		
admin	get, post, put, delete, head	.security, .authuser, _auth, .trustedhost	 		
alert	get, post, put, delete, head	alert*, .alertrules, .risks, .riskcategories, .playbooks	 		
intelligence	get, post, put, delete, head	intelligence*, .intelligence*	 		
kibana	get, post, put, head, delete	.kibana, .taskmanagement, .reportscheduler, _cluster*, license, user	 		
logstash	get, post, put, head	_bulk, _template	 		
security	get	_incidents	 		

As we can see, the new role has been added to the list. With the Delete button we have the option of deleting it, while under the Update button we have a drop-down menu thanks to which we can add or remove an index pattern and add or remove a method. When we want to confirm the changes, we choose the Submit button. Pressing the Update button again will close the menu.

Fresh installation of the application have sewn solid roles which granting user special rights:

- admin - this role gives unlimited permissions to administer / manage the application
- alert - a role for users who want to see the Alert module
- kibana - a role for users who want to see the application GUI
- Intelligence - a role for users who are to see the Intelligence moduleObject access permissions (Objects permissions)

In the User Manager tab we can parameterize access to the newly created role as well as existing roles. In this tab we can indicate to which object in the application the role has access.

Example:

In the Role List tab we have a role called **sys2**, it refers to all index patterns beginning with syslog\* and the methods get, post, delete, put and head are assigned.

[Create User](#)

Object Name	Type	Object Name	Type	Update Permission
<input type="checkbox"/> [AD1] Account User Activity	vis			No items found
<input type="checkbox"/> [AD1] Groups Overview by User	vis			
<input type="checkbox"/> [AD1] Login Events	visualization			

Add > < Remove

From the list we have the opportunity to choose another object that we can add to the role. We have the ability to quickly find this object in the search engine (Find) and narrowing the object class in the drop-down field “Select object type”. The object type are associated with saved previously documents in the sections Dashboard, Index pattern, Search and Visualization. By buttons

we have the ability to add or remove or object, and Save button to save the selection.

## 7.4 Default user and passwords

The table below contains built-in user accounts and default passwords:

Address	User	Password	Role	Description
	Usage			
https://localhost:5601	logserver	logserver	logserver	A built-in
*superuser* account				
for the Alert module	alert	alert	alert	A built-in account
for the Intelligence module	intelligence	intelligence	intelligence	A built-in account
authorizing communication with elasticsearch server	scheduler	scheduler	scheduler	A built-in account
for the Scheduler module	logstash	logstash	logstash	A built-in account
authorized communication form Logstash	cerebro		system account only	A built-in
account for authorized communication from Cerebro module				

## 7.5 Changing password for the system account

After you change password for one of the system account ( alert, intelligence, logserver, scheduler), you must to do appropriate changes in the application files.

### 1. Account **Logserver**

- Update */etc/kibana/kibana.yml*:

```
vi /etc/kibana/kibana.yml
elasticsearch.password: new_logserver_passowrd
elastfilter.password: "new_logserver_password"
cerebro.password: "new_logserver_password"
```

### 2. Account **Intelligence**

- Update */opt/ai/bin/conf.cfg*

```
vi /opt/ai/bin/conf.cfg
password=new_intelligence_password
```

### 3. Account **Alert**

- Update file */opt/alert/config.yaml*

```
vi /opt/alert/config.yaml
es_password: alert
```

### 4. Account **Scheduler**

- Update */etc/kibana/kibana.yml*:

```
vi /etc/kibana/kibana.yml
elastscheduler.password: "new_scheduler_password"
```

### 5. Account **Logstash**

- Update the Logstash pipeline configuration files (\*.conf) in output sections:

```
vi /etc/logstash/conf.d/*.conf
elasticsearch {
 hosts => ["localhost:9200"]
 index => "syslog-%{+YYYY.MM}"
 user => "logstash"
 password => "new_password"
}
```

#### 8.1 General Settings

The Settings tab is used to set the audit on different activates or events and consists of several fields:

User Management

Settings

License Info

Time Out in minutes (use 0 for longer time-out)

NaN

Submit

Delete Application Tokens (in days)

<html><head><title>Energy-LogServer Login</title><link href="/ui/favicons/favicon-32x32.png" rel="shortcut icon"><link async rel="stylesheet" href="/bundles/login.style.css"></head><body>

- **Time Out in minutes** field - this field defines the time after how many minutes the application will automatically log you off
- **Delete Application Tokens (in days)** - in this field we specify after what time the data from the audit should be deleted
- **Delete Audit Data (in days)** field - in this field we specify after what time the data from the audit should be deleted
- Next field are checkboxes in which we specify what kind of events are to be logged (saved) in the audit index. The events that can be monitored are: logging (Login), logging out (Logout), creating a user (Create User), deleting a user (Delete User), updating user (Update User), creating a role (Create Role), deleting a role (Delete Role), update of the role (Update Role), start of export (Export Start), delete of export (Export Delete), queries (Queries), result of the query (Content), if attempt was made to perform a series of operation (Bulk)
- **Delete Exported CSVs (in days)** field - in this field we specify after which time exported file with CSV extension have to be removed
- **Delete Exported PDFs (in days)** field - in this field we specify after which time exported file with PDF extension have to be removed

To each field is assigned “Submit” button thanks to which we can confirm the changes.

## 8.2 License (License Info)

The License Information tab consists of several non-editable information fields.

User Management	Settings	<b>License Info</b>
-----------------	----------	---------------------

---

Company: Foo Bar

Data nodes in cluster : 10

---

No of documents :

---

Indices : [\*]

---

Issued on : 2019-05-30T08:49:20.042034300

---

Validity : 120 months

---

Version : 7.0.1

These fields contain information:

- Company field, who owns the license - in this case EMCA S.A.
- Data nodes in cluster field - how many nodes we can put in one cluster - in this case 100
- No of documents field - empty field
- Indices field - number of indexes, symbol[\*] means that we can create any number of indices
- Issued on field - date of issue
- Validity field - validity, in this case for 360000 months

## 8.3 Special accounts

At the first installation of the Energy Logserver application, apart from the administrative account (logserver), special applications are created in the application: alert, intelligence and scheduler.

<a href="#">User Management</a> <a href="#">Settings</a> <a href="#">License Info</a>				
<a href="#">Create User</a> <a href="#">User List</a> <a href="#">Create Role</a> <a href="#">Role List</a> <a href="#">Objects Permission</a>				
Username	Roles	Default Role	Email	Actions
alert	admin			 
intelligence	admin			 
logserver	admin			 
logstash	logstash			 
scheduler	admin			 

- **Alert Account** - this account is connected to the Alert Module which is designed to track events written to the index for the previously defined parameters. If these are met the information action is started (more on the action in the Alert section)
- **Intelligence Account** - with this account is related to the module of artificial intelligence which is designed to track events and learn the network based on previously defined rules artificial intelligence based on one of the available algorithms (more on operation in the Intelligence chapter)
- **Scheduler Account** - the scheduler module is associated with this account, which corresponds to, among others for generating reports

Energy Logserver allows you to create alerts, i.e. monitoring queries. These are constant queries that run in the background and when the conditions specified in the alert are met, the specify action is taken.

For example, if you want to know when more than 20 „status:500” response code from on our homepage appear within an one hour, then we create an alert that check the number of occurrences of the „status:500” query for a specific index every 5 minutes. If the condition we are interested in is met, we send an action in the form of sending a message to our e-mail address. In the action, you can also set the launch of any script.

### 9.1 Enabling the Alert Module

To enabling the alert module you should:

- generate writeback index for Alert service:

Only applies to versions 6.1.5 and older. From version 6.1.6 and later, the Alert index is created automatically

```
/opt/alert/bin/elastalert-create-index --config /opt/alert/config.yaml
```

- configure the index pattern for alert\*

## Create index pattern

Kibana uses index patterns to retrieve data from Elasticsearch indices for things like visualizations.

☐ Include system indices

### Step 1 of 2: Define index pattern

#### Index pattern

audit\*

You can use a \* as a wildcard in your index pattern.  
You can't use spaces or the characters \, /, ?, " , <, >, |.

> Next step

✓ **Success!** Your index pattern matches **1 index**.

audit

Rows per page: 10 ▾

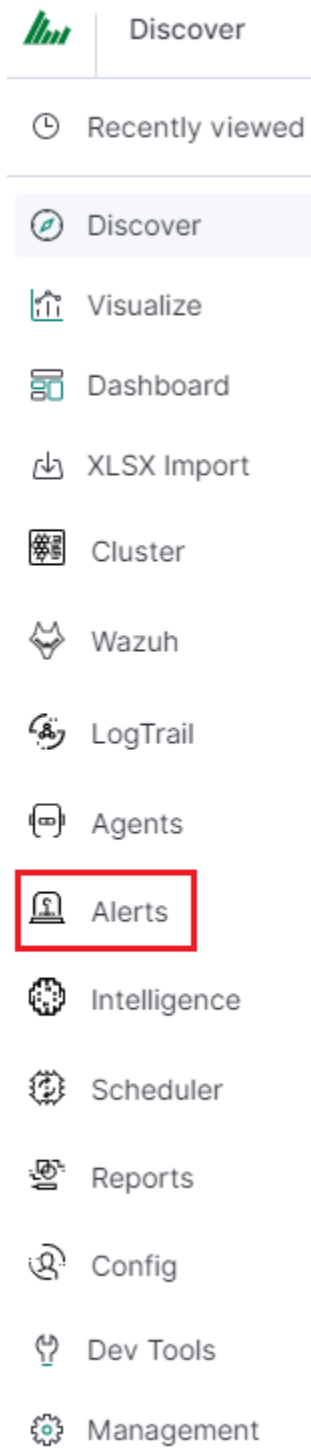

- start the Alert service:

```
`systemctl start alert`
```

## 9.2 Creating Alerts

To create the alert, click the “Alerts” button from the main menu bar.

We will display a page with tree tabs: Create new alerts in „Create alert rule”, manage alerts in „Alert rules List” and check alert status „Alert Status”.

In the alert creation windows we have an alert creation form:

[Create alert rule](#) [Alert rules List](#) [Alerts Status](#) [Playbook](#) [Risks](#) [Incidents](#)

Create Alert

☐

Example

Example

Alert method

None

Any

Playbooks

Test rule

- **Name** - the name of the alert, after which we will recognize and search for it.
- **Index pattern** - a pattern of indexes after which the alert will be searched.
- **Role** - the role of the user for whom an alert will be available
- **Type** - type of alert
- **Description** - description of the alert.
- **Example** - an example of using a given type of alert. Descriptive field
- **Alert method** - the action the alert will take if the conditions are met (sending an email message or executing a command)
- **Any** - additional descriptive field.

The “Alert Rule List” tab contain complete list of previously created alert rules:

Create alert rule	Alert rules List	Alerts Status	Playbook	Risks	Incidents
Alert rules List <span>↺</span>					
<input type="text" value="Search an Alert rule name"/> <input type="text" value="Search an Index pattern name"/> <input type="text" value="Search an Alert type"/>					
Name	Index pattern	Type	Alert method	Role	Actions
Audit Problems	audit	any	none	["admin"]	<span>Show</span> <span>Disable</span> <span>Update</span> <span>Delete</span>

In this window, you can activate / deactivate, delete and update alerts by clicking on the selected icon with the given

alert:

Show
Disable
Update
Delete

## 9.3 Alerts status

In the “Alert status” tab, you can check the current alert status: if it activated, when it started and when it ended, how long it lasted, how many event sit found and how many times it worked.

Create alert rule	Alert rules List	Alerts Status	Playbook	Risks	Incidents
Alerts Status					
Alert module status: <span>RUNNING</span>					<span>Recovery Alert Dashboard</span>
Name	Start time	End time	Time taken	Hits	Matches
Audit Problems	2020-03-25 12:44:53	2020-03-25 12:59:53	0.019505023956298828	0	0
Audit Problems	2020-03-25 12:43:55	2020-03-25 12:58:55	0.01165318489074707	0	0

Also, on this tab, you can recover the alert dashboard, by clicking the “Recovery Alert Dashboard” button.

## 9.4 Alert rules

The various RuleType classes, defined in Energy Logserver. An instance is held in memory for each rule, passed all of the data returned by querying Elasticsearch with a given filter, and generates matches based on that data.

- **Any** - The any rule will match everything. Every hit that the query returns will generate an alert.
- **Blacklist** - The blacklist rule will check a certain field against a blacklist, and match if it is in the blacklist.
- **Whitelist** - Similar to blacklist, this rule will compare a certain field to a whitelist, and match if the list does not contain the term.
- **Change** - This rule will monitor a certain field and match if that field changes.
- **Frequency** - This rule matches when there are at least a certain number of events in a given time frame.
- **Spike** - This rule matches when the volume of events during a given time period is spike\_height times larger or smaller than during the previous time period.
- **Flatline** - This rule matches when the total number of events is under a given threshold for a time period.
- **New Term** - This rule matches when a new value appears in a field that has never been seen before.
- **Cardinality** - This rule matches when the total number of unique values for a certain field within a time frame is higher or lower than a threshold.
- **Metric Aggregation** - This rule matches when the value of a metric within the calculation window is higher or lower than a threshold.
- **Percentage Match** - This rule matches when the percentage of document in the match bucket within a calculation window is higher or lower than a threshold.
- **Unique Long Term** - This rule matches when there are values of compare\_key in each checked timeframe.
- **Find Match** - Rule match when in defined period of time, two correlated documents match certain strings.
- **Difference** - Rule matches for value difference between two aggregations calculated for different periods in time.
- **ConsecutiveGrowth** - Rule matches for value difference between two aggregations calculated for different periods in time.
- **Logical** - Rule matches when a complex, logical criteria is met. Rule can be use for alert data correlation.
- **Chain** - Rule matches when a complex, logical criteria is met. Rule can be use for alert data correlation.

### 9.4.1 Logical

An example of using the Logical rule type.

Type: Chain

Role: admin

Description: This rule matches when a complex, logical criteria is met. Rule can be use for alert data correlation.

Alert Method: None

Filter options:

- Checkpoint - Application Block by user
- Checkpoint - Block action by user
- Checkpoint - Connection was detected by Interspect
- Checkpoint - Connection was subject to a configured protections
- Checkpoint - Connection with source IP was quarantined
- Checkpoint - Connection with source IP was routed through the gateway acting as a...

Timeframe (in minutes): 5

Enable alert body correlation: ☒ Get Alert Fields

Correlate Fields: username

Rule	No of match	Order
Linux - Login Failure	10	^ v
Linux - Login Success	1	^ v

Alerts that must occur for the rule to be triggered:

- Switch - Port is off-line - the alert must appear 5 times.
- OR
- Switch - Port is on-line - the alert must appear 5 times.

If both of the above alerts are met within no more than 5 minutes and the values of the “port\_number” field are related to each other, the alert rule is triggered. It is possible to use logical connectives such as: OR, AND, NOR, NAND, XOR.

## 9.4.2 Chain

An example of using the Chain rule type.

Type: Chain

Role: admin

Description: This rule matches when a complex, logical criteria is met. Rule can be use for alert data correlation.

Alert Method: None

Filter options:

- Checkpoint - Application Block by user
- Checkpoint - Block action by user
- Checkpoint - Connection was detected by Interspect
- Checkpoint - Connection was subject to a configured protections
- Checkpoint - Connection with source IP was quarantined
- Checkpoint - Connection with source IP was routed through the gateway acting as a...

Timeframe (in minutes): 5

Enable alert body correlation: ☒ Get Alert Fields

Correlate Fields: username

Rule	No of match	Order
Linux - Login Failure	10	^ v
Linux - Login Success	1	^ v

Alerts that must occur for the rule to be triggered:

- Linux - Login Failure - the alert must appear 10 times.
- AND
- Linux - Login Success - 1 time triggered alert.

If the sequence of occurrence of the above alerts is met within 5 minutes and the values of the “username” field are related to each other, the alert rule is triggered. The order in which the component alerts occur is important.

## 9.5 Alert Type

When the alert rule is fulfilled, the defined action is performed - the alert method. The following alert methods have been predefined in the system:

- email;
- commands;
- user;

### 9.5.1 Email

Method that sends information about an alert to defined email addresses.

### 9.5.2 User

Method that sends information about an alert to defined system users.

### 9.5.3 Command

A method that performs system tasks. For example, it triggers a script that creates a new event in the customer ticket system.

Below is an example of an alert rule definition that uses the “command” alert method to create and recover an ticket in the client’s request system:

```
index: op5-*
name: change-op5-hoststate
type: change

compare_key: hoststate
ignore_null: true
query_key: hostname

filter:
- query_string:
 query: "_exists_: hoststate AND datatype: \"HOSTPERFDATA\" AND _exists_: hostname"

realert:
 minutes: 0
alert: "command"
command: ["/opt/alert/send_request_change.sh", "5", "%(hostname)s", "SYSTEM_DOWN",
↪ "HOST", "Application Collection", "%(hoststate)s", "%(@timestamp)s"]
```

The executed command has parameters which are the values of the fields of the executed alert. Syntax: `%(fields_name)`.

## 9.6 Example of rules

### 9.6.1 Unix - Authentication Fail

- index pattern:

```
syslog-*
```

- Type:

```
Frequency
```

- Alert Method:

```
Email
```

- Any:

```
num_events: 4
timeframe:
 minutes: 5

filter:
- query_string:
 query: "program: (ssh OR sshd OR su OR sudo) AND message: \"Failed password\"
↪ "
```

### 9.6.2 Windows - Firewall disable or modify

- index pattern:

```
beats-*
```

- Type:

```
Any
```

- Alert Method:

```
Email
```

- Any:

filter:

```
- query_string:
 query: "event_id:(4947 OR 4948 OR 4946 OR 4949 OR 4954 OR 4956 OR 5025)
↪ "
```

Nr.	Architecture/Application	Rule Name	Description	Index name	Source
1	Windows	Windows - Admin night logon	Alert on Windows login events when detected outside business hours	winlogbeat-*	Widnows Security Eventlog
2	Windows	Windows - Admin task as user	Alert when admin task is initiated by regular user. Windows event id 4732 is verified towards static admin list. If the user does not belong to admin list AND the event is seen than we generate alert. Static Admin list is a logstash dicstionary file that needs to be created manually. During Logstash lookup a field user.role:admin is added to an event.4732: A member was added to a security-enabled local group	winlogbeat-*	winlogbeatLogstash admin dicstionary lookup file   Widnows Security Eventlog

## 9.7 Playbooks

Energy Logserver has a set of predefined set of rules and activities (called Playbook) that can be attached to a registered event in the Alert module. Playbooks can be enriched with scripts that can be launched together with Playbook.

### 9.7.1 Create Playbook

To add a new playbook, go to the **Alert** module, select the **Playbook** tab and then **Create Playbook**

[Create alert rule](#) [Alert rules List](#) [Alerts Status](#) **Playbook** [Risks](#) [Incidents](#)

**Create playbook** [Playbooks list](#)

Create playbook

**Name**

Playbook Name

**Text**

**Script**

**Submit**

In the **Name** field, enter the name of the new Playbook.

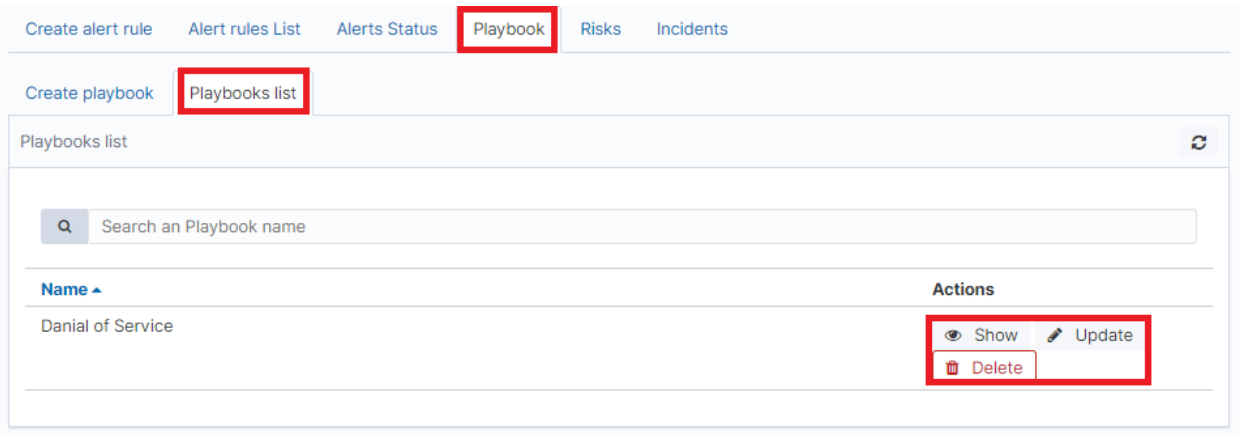

In the **Text** field, enter the content of the Playbook message.

In the **Script** field, enter the commands to be executed in the script.

To save the entered content, confirm with the **Submit** button.

## 9.7.2 Playbooks list

To view saved Playbook, go to the **Alert** module, select the **Playbook** tab and then **Playbooks list**:

To view the content of a given Playbook, select the **Show** button.

To enter the changes in a given Playbook or in its script, select the **Update** button. After making changes, select the **Submit** button.

To delete the selected Playbook, select the **Delete** button.

## 9.7.3 Linking Playbooks with alert rule

You can add a Playbook to the Alert while creating a new Alert or by editing a previously created Alert.

To add Palybook to the new Alert rule, go to the **Create alert rule** tab and in the **Playbooks** section use the arrow keys to move the correct Playbook to the right window.

To add a Palybook to existing Alert rule, go to the **Alert rule list** tab with the correct rule select the **Update** button and in the **Playbooks** section use the arrow keys to move the correct Playbook to the right window.

## 9.7.4 Playbook verification

When creating an alert or while editing an existing alert, it is possible that the system will indicate the most-suited playbook for the alert. For this purpose, the Validate button is used, which starts the process of searching the existing playbook and selects the most appropriate ones.

Any

```

timeframe:
 minutes: 1

filter:
- query:
 query_string:
 query: "tags:badip AND _exists_: (netflow.ipv4_dst_addr OR dst_ip OR netflow.sourceIPv4Address OR netflow.ipv4_src_addr)"

include: ["netflow.ipv4_dst_addr", "dst_ip", "netflow.sourceIPv4Address", "netflow.ipv4_src_addr", "kibana_link"]

alert_subject: "Bad Reputation IP"
alert_text: "Bad Reputation IP: {0}{1}{2}{3}\nDocument matched against bad reputation source:\n\n{4}"
alert_text_args: ["netflow.ipv4_dst_addr", "dst_ip", "netflow.sourceIPv4Address", "netflow.ipv4_src_addr", "@timestamp",

```

**Validate**

**Playbooks**

Malware Infection

Bad reputation IP  
Bad reputation site

## 9.8 Risks

Energy Logserver allows you to estimate the risk based on the collected data. The risk is estimated based on the defined category to which the values from 0 to 100 are assigned.

Information on the defined risk for a given field is passed with an alert and multiplied by the value of the Rule Importance parameter.

### 9.8.1 Create category

To add a new risk Category, go to the **Alert** module, select the **Risks** tab and then **Create Category**.

Create alert rule   Alert rules List   Alerts Status   Playbook   **Risks**   Incidents

Create risk   Risks list   **Create category**   Categories list

Create category

Name

Category Name

Value (0 - 100%)

50

**Submit**

Enter the **Name** for the new category and the category **Value**.

## 9.8.2 Category list

To view saved Category, go to the **Alert** module, select the **Risks** tab and then **Categories list**:

Categories list

Search an Category name

Name ▲	Value	Actions
High	90	<a href="#">Show</a> <a href="#">Update</a> <a href="#">Delete</a>
Low	20	<a href="#">Show</a> <a href="#">Update</a> <a href="#">Delete</a>
Medium	50	<a href="#">Show</a> <a href="#">Update</a> <a href="#">Delete</a>
uncategorized	0	<a href="#">Show</a> <a href="#">Update</a>

To view the content of a given Category, select the **Show** button.

To change the value assigned to a category, select the **Update** button. After making changes, select the **Submit** button.

To delete the selected Category, select the **Delete** button.

## 9.8.3 Create risk

To add a new playbook, go to the Alert module, select the Playbook tab and then Create Playbook

Create alert rule   Alert rules List   Alerts Status   Playbook   **Risks**   Incidents

**Create risk**   Risks list   Create category   Categories list

Create risk

Index pattern  
audit\*

**Read fields**

operation

Time range  
Last 24 hours

**Read values**

Search an Risk field name   Search an Risk category name

<input type="checkbox"/>		
<input type="checkbox"/>	LOGIN	High
<input type="checkbox"/>	QUERY	Low
<input type="checkbox"/>	USER_UPDATE	Medium

**Submit**

In the **Index pattern** field, enter the name of the index pattern. Select the **Read fields** button to get a list of fields from the index. From the box below, select the field name for which the risk will be determined.

From the **Timerange field**, select the time range from which the data will be analyzed.

Press the **Read values** button to get values from the previously selected field for analysis.

Next, you must assign a risk category to the displayed values. You can do this for each value individually or use the check-box on the left to mark several values and set the category globally using the **Set global category** button. To quickly find the right value, you can use the search field.

Search an Risk field name   Search an Risk category name

☒ **Set global category**

<input checked="" type="checkbox"/>	LOGIN	High
<input checked="" type="checkbox"/>	QUERY	Low
<input checked="" type="checkbox"/>	USER_UPDATE	Medium

**Submit**

After completing, save the changes with the **Submit** button.

### 9.8.4 List risk

To view saved risks, go to the **Alert** module, select the **Risks** tab and then **Risks list**:

[Create alert rule](#)
[Alert rules List](#)
[Alerts Status](#)
[Playbook](#)
[Risks](#)
[Incidents](#)

[Create risk](#)
[Risks list](#)
[Create category](#)
[Categories list](#)

Risks list 

<input type="checkbox"/>	Field name	Field value	Category	Actions
<input type="checkbox"/>	operation	LOGIN	High	 Update  Delete
<input type="checkbox"/>	operation	QUERY	Low	 Update  Delete
<input type="checkbox"/>	operation	USER_UPDATE	Medium	 Update  Delete

To view the content of a given Risk, select the **Show** button.

To enter the changes in a given Risk, select the **Update** button. After making changes, select the **Submit** button.

To delete the selected Risk, select the **Delete** button.

## 9.8.5 Linking risk with alert rule

You can add a Risk key to the Alert while creating a new Alert or by editing a previously created Alert.

To add Risk key to the new Alert rule, go to the **Create alert rule** tab and after entering the index name, select the **Read fields** button and in the **Risk key** field, select the appropriate field name. In addition, you can enter the validity of the rule in the **Rule Importance** field (in the range 1-100%), by which the risk will be multiplied.

To add Risk key to the existing Alert rule, go to the **Alert rule list**, tab with the correct rule select the **Update** button. Use the **Read fields** button and in the **Risk key** field, select the appropriate field name. In addition, you can enter the validity of the rule in the **Rule Importance**.

## 9.8.6 Risk calculation algorithms

The risk calculation mechanism performs the aggregation of the risk field values. We have the following algorithms for calculating the alert risk (Aggregation type):

- min - returns the minimum value of the risk values from selected fields;
- max - returns the maximum value of the risk values from selected fields;
- avg - returns the average of risk values from selected fields;
- sum - returns the sum of risk values from selected fields;
- custom - returns the risk value based on your own algorithm

## 9.8.7 Adding a new risk calculation algorithm

The new algorithm should be added in the `./elastalert_modules/playbook_util.py` file in the `calculate_risk` method. There is a sequence of conditional statements for already defined algorithms:

```
#aggregate values by risk_key_aggregation for rule
if risk_key_aggregation == "MIN":
 value_agg = min(values)
elif risk_key_aggregation == "MAX":
 value_agg = max(values)
elif risk_key_aggregation == "SUM":
 value_agg = sum(values)
elif risk_key_aggregation == "AVG":
 value_agg = sum(values)/len(values)
else:
 value_agg = max(values)
```

To add a new algorithm, add a new sequence as shown in the above code:

```
elif risk_key_aggregation == "AVG":
 value_agg = sum(values)/len(values)
elif risk_key_aggregation == "AAA":
 value_agg = BBB
else:
 value_agg = max(values)
```

where **AAA** is the algorithm code, **BBB** is a risk calculation function.

### 9.8.8 Using the new algorithm

After adding a new algorithm, it is available in the GUI in the Alert tab.

To use it, add a new rule according to the following steps:

- Select the custom value in the Aggregation type field;
- Enter the appropriate value in the Any field, e.g. `risk_key_aggregation: AAA`

The following figure shows the places where you can call your own algorithm:

(continued from previous page)

```

 value_agg = min(values)
 elif risk_key_aggregation == "MAX":
 value_agg = max(values)
 elif risk_key_aggregation == "SUM":
 value_agg = sum(values)
 elif risk_key_aggregation == "AVG":
 value_agg = sum(values)/len(values)
 else:
 value_agg = max(values)

```

Risk\_key is the array of selected risk key fields in the GUI. A loop is made on this array and a value is collected for the categories in the line:

```
value = float(self.get_risk_category_value(risk_key, key_value))
```

Based on, for example, Risk\_key, you can multiply the value of the value field by the appropriate weight. The value field value is then added to the table on which the risk calculation algorithms are executed.

## 9.9 Indicators of compromise (IoC)

ITRS Log-Analytics has the Indicators of compromise (IoC) functionality, which is based on the Malware Information Sharing Platform (MISP). IoC observes the logs sent to the system and marks documents if their content is in MISP signature. Based on IoC markings, you can build alert rules or track incident behavior.

### 9.9.1 Configuration

#### Bad IP list update

To update bad reputation lists and to create .blacklists index, you have to run following scripts:

```

/etc/logstash/lists/bin/badreputation_iplists.sh
/etc/logstash/lists/bin/misp_threat_lists.sh

```

#### Scheduling bad IP lists update

This can be done in cron (host with Logstash installed):

```

0 1 * * * logstash /etc/logstash/lists/bin/badreputation_iplists.sh
0 6 * * * logstash /etc/logstash/lists/bin/misp_threat_lists.sh

```

or with Kibana Scheduler app (**only if Logstash is running on the same host**).

- Prepare script path:

```

/bin/ln -sf /etc/logstash/lists/bin /opt/ai/bin/lists
chown logstash:kibana /etc/logstash/lists/
chmod g+w /etc/logstash/lists/

```

- Log in to EnergyLogserver GUI and go to **Scheduler** app. Set it up with below options and push “Submit” button:

```
Name: BadReputationList
Cron pattern: 0 1 * * *
Command: lists/badreputation_iplists.sh
Category: logstash
```

and second:

```
Name: MispThreatList
Cron pattern: 0 1 * * *
Command: lists/misp_threat_lists.sh
Category: logstash
```

After a couple of minutes check for blacklists index:

```
curl -sS -u user:password -XGET '127.0.0.1:9200/_cat/indices/.blacklists?s=index&v'
health status index uuid pri rep docs.count docs.deleted
↪store.size pri.store.size
green open .blacklists Mld2Qe2bSRuk2VyKm-KoGg 1 0 76549 0
↪4.7mb 4.7mb
```

## Configuration alert rule

## CHAPTER 10

---

### Intelligence Module

---

A dedicated artificial intelligence module has been built in the Energy Logserver system that allows prediction of parameter values relevant to the maintenance of infrastructure and IT systems. Such parameters include:

- use of disk resources,
- use of network resources,
- using the power of processors
- detection of known incorrect behaviour of IT systems

To access of the Intelligence module, click the tile icon from the main menu bar and then go to the „Intelligence” icon (To go back, click to the „Search” icon).

Logged in as : logserver

Create AI Rule

[AI Rules List](#)

[AI Learn](#)

[AI Learn Tasks](#)

There are 4 screens available in the module:

- **Create AI Rule** - the screen allows you to create artificial intelligence rules and run them in scheduler mode or immediately

- **AI Rules List** - the screen presents a list of created artificial intelligence rules with the option of editing, previewing and deleting them
- **AI Learn** - the screen allows to define the conditions for teaching the MLP neural network
- **AI Learn Tasks** - a screen on which the initiated and completed learning processes of neural networks with the ability to preview learning results are presented.

To create the AI Rule, click on the tile icon from the main menu bar, go to the „Intelligence” icon and select “Create AI Rule” tab. The screen allows to defining the rules of artificial intelligence based on one of the available algorithms (a detailed description of the available algorithms is available in a separate document).

Description of the controls available on the fixed part of screen:

- **Algorithm** - the name of the algorithm that forms the basis of the artificial intelligence rule
- **Choose search** - search defined in the Energy Logserver system, which is used to select a set of data on which the artificial intelligence rule will operate
- **Run** - a button that allows running the defined AI rule or saving it to the scheduler and run as planned

The rest of the screen will depend on the chosen artificial intelligence algorithm.

## 10.1 The fixed part of the screen

Description of the controls available on the fixed part of screen:

- **Algorithm** - the name of the algorithm that forms the basis of the artificial intelligence rule
- **Choose search** - search defined in the Energy Logserver system, which is used to select a set of data on which the artificial intelligence rule will operate
- **Run** - a button that allows running the defined AI rule or saving it to the scheduler and run as planned

The rest of the screen will depend on the chosen artificial intelligence algorithm.

## 10.2 Screen content for regressive algorithms

Algorithm:

Simple Moving Average

Choose search:

Uslugi\_WWW\_with\_cols

AI Rule Name:

my\_test\_

Feature to analyse (from search):

perf\_data./

Multiply by field (from search):

hostname

Multiply by values (from search):

emPRD\_Aligator\_linux  
emPRD\_Cyberoam\_public\_FC  
emPRD\_ESX6\_optima64  
emPRD\_RHEL

Time frame:

Day

Value type:

Average

Max probes:

20

Max predictions:

30

Data limit:

10000000

Start date:

2018-04-06 09:51:31

Scheduler:

☐

Role:

admin  
ALL\_test  
audit  
databases

Description of controls:

- **feature to analyze from search** - analyzed feature (dictated)
- **multiply by field** - enable multiplication of algorithms after unique values of the feature indicated here. Multiplication allows you to run the AI rule one for e.g. all servers. The value “none” in this field means no multiplication.
- **multiply by values** - if a trait is indicated in the „multiply by field”, then unique values of this trait will appear in this field. Multiplications will be made for the selected values. If at least one of value is not selected, the „Run” buttons will be inactive.

In other words, multiplication means performing an analysis for many values from the indicated field, for example: `source_node_host`- which we indicate in `Multiply by field` (from search).

However, in `Multiply by values` (from search) we already indicate values of this field for which the analysis will be performed, for example: `host1, host2, host3, ...`

- **time frame** - feature aggregation method (1 minute, 5 minute, 15 minute, 30 minute, hourly, weekly, monthly, 6 months, 12 months)
- **max probes** - how many samples back will be taken into account for analysis. A single sample is an aggregated data according to the aggregation method.
- **value type** - which values to take into account when aggregating for a given time frame (e.g. maximum from time frame, minimum, average)
- **max predictions** - how many estimates we make for ahead (we take time frame)
- **data limit** - limits the amount of data downloaded from the source. It speeds up processing but reduces its quality
- **start date** - you can set a date earlier than the current date in order to verify how the selected algorithm would work on historical data
- **Scheduler** - a tag if the rule should be run according to the plan for the scheduler. If selected, additional fields will appear;

---

**Scheduler:** ☒

---

**Prediction cycle  
(crontab format):**

---

**Enable:** ☐

- **Prediction cycle** - plan definition for the scheduler, i.e. the cycle in which the prediction rule is run (e.g. once a day, every hour, once a week). In the field, enter the command that complies with the cron standard. Enable – whether to immediately launch the scheduler plan or save only the definition
- **Role** - only users with the roles selected here and the administrator will be able to run the defend AI rules The selected „time frame” also affects the prediction period. If we choose “time frame = monthly”, we will be able to predict a one month ahead from the moment of prediction (according to the “prediction cycle” value)

## 10.3 Screen content for the Trend algorithm

**Algorithm:**

Trend

**Choose search:**

Uslugi\_WWW\_with\_cols

---

AI Rule Name:

---

Feature to analyse (from search):

---

Max predictions:

---

Data limit:

---

Start date:

---

Threshold:

---

Scheduler: ☐

---

Role:

admin  
ALL\_test  
audit  
databases

Description of controls:

- **feature to analyze from search** - analyzed feature (dictated)
- **multiply by field** - enable multiplication of algorithms after unique values of the feature indicated here. Multiplication allows you to run the AI rule one for e.g. all servers. The value “none” in this field means no multiplication.
- **multiply by values** - if a trait is indicated in the „multiply by field”, then unique values of this trait will appear in this field. Multiplications will be made for the selected values. If at least one of value is not selected, the „Run” buttons will be inactive.

In other words, multiplication means performing an analysis for many values from the indicated field, for example: `source_node_host`- which we indicate in `Multiply by field (from search)`.

However, in `Multiply by values (from search)` we already indicate values of this field for which the analysis will be performed, for example: `host1, host2, host3, ...`.

- **time frame** - feature aggregation method (1 minute, 5 minute, 15 minute, 30 minute, hourly, weekly, monthly, 6 months, 12 months)
- **max probes** - how many samples back will be taken into account for analysis. A single sample is an aggregated data according to the aggregation method.
- **value type** - which values to take into account when aggregating for a given time frame (e.g. maximum from time frame, minimum, average)
- **max predictions** - how many estimates we make for ahead (we take time frame)
- **data limit** - limits the amount of data downloaded from the source. It speeds up processing but reduces its quality
- **start date** - you can set a date earlier than the current date in order to verify how the selected algorithm would work on historical data
- **Scheduler** - a tag if the rule should be run according to the plan for the scheduler. If selected, additional fields will appear;

---

Scheduler: ☒

---

Prediction cycle  
(crontab format):

---

Enable: ☐

- **Prediction cycle** - plan definition for the scheduler, i.e. the cycle in which the prediction rule is run (e.g. once a day, every hour, once a week). In the field, enter the command that complies with the cron standard. Enable – whether to immediately launch the scheduler plan or save only the definition
- **Role** - only users with the roles selected here and the administrator will be able to run the defend AI rules The selected „time frame” also affects the prediction period. If we choose “time frame = monthly”, we will be able to predict a one month ahead from the moment of prediction (according to the “prediction cycle” value)
- **Threshold** - default values -1 (do not search). Specifies the algorithm what level of exceeding the value of the feature „feature to analyze from cheese” is to look for. The parameter currently used only by the “Trend” algorithm.

## 10.4 Screen content for the neural network (MLP) algorithm

perf_data.pl	perf_data.pl	0.006104901588956799		

Descriptions of controls:

- **Name** - name of the learned neural network
- **Choose search** - search defined in Energy Logserver, which is used to select a set of data on which the rule of artificial intelligence will work
- **Below**, on the left, a list of attributes and their weights based on teaching ANN will be defined during the teaching. The user for each attribute will be able to indicate the field from the above mentioned search, which contain the values of the attribute and which will be analyzed in the algorithm. The presented list (for input and output attributes) will have a static and dynamic part. Static creation by presenting key with the highest weights. The key will be presented in the original form, i.e. perf\_data./ The second part is a DropDown type list that

will serve as a key update according to the user's naming. On the right side, the attribute will be examined in a given rule / pattern. Here also the user must indicate a specific field from the search. In both cases, the input and output are narrowed based on the search fields indicated in Choose search.

- **Data limit** - limits the amount of data downloaded from the source. It speeds up the processing, but reduces its quality.
- **Scheduler** - a tag if the rule should be run according to the plan or the scheduler. If selected, additional fields will appear:

---

Scheduler: ☒

---

Prediction cycle  
(crontab format):

---

Enable: ☐

- **Prediction cycle** - plan definition for the scheduler, i.e. the cycle in which the prediction rule is run (e.g. once a day, every hour, once a week). In the field, enter the command that complies with the *cron* standard
- **Enable** - whether to immediately launch the scheduler plan or save only the definition
- **Role** - only users with the roles selected here and the administrator will be able to run the defined AI rules

Labels rows count:

Description of controls:

- **Search** - a source of data for teaching the network
- **prefix name** - a prefix added to the id of the learned model that allows the user to recognize the model
- **Input cols** - list of fields that are analyzed / input features. Here, the column that will be selected in the output col should not be indicated. Only those columns that are related to processing should be selected. \*\*
- **Output col** - result field, the recognition of which is learned by the network. **This field should exist in the learning and testing data, but in the production data is unnecessary and should not occur. This field cannot be on the list of selected fields in “input col”.**
- **Output class category** - here you can enter a condition in SQL format to limit the number of output categories e.g. `if((outputCol) < 10, (floor((outputCol))+1), Double(10))`. This condition limits

the number of output categories to 10. **Such conditions are necessary for fields selected in “output col” that have continuous values. They must necessarily be divided into categories. In the Condition, use your own outputCol name instead of the field name from the index that points to the value of the “output col” attribute.**

- **Time frame** - a method of aggregation of features to improve their quality (e.g. 1 minute, 5 minutes, 15 minutes, 30 minutes, 1 hour, 1 daily).
- **Time frames output shift** - indicates how many time frame units to move the output category. This allows teaching the network with current attributes, but for categories for the future.
- **Value type** - which values to take into account when aggregating for a given time frame (e.g. maximum from time frame, minimum, average)
- **Output class count**- the expected number of result classes. **If during learning the network identifies more classes than the user entered, the process will be interrupted with an error, therefore it is better to set up more classes than less, but you have to keep in mind that this number affects the learning time.**
- **Neurons in first hidden layer (from, to)** - the number of neurons in the first hidden layer. Must have a value > 0. Jump every 1.
- **Neurons in second hidden layer (from, to)** - the number of neurons in second hidden layer. If = 0, then this layer is missing. Jump every 1.
- **Neurons in third hidden layer (from, to)** - the number of neurons in third hidden layer. If = 0 then this layer is missing. Jump every 1.
- **Max iter** (from, to) - maximum number of network teaching repetitions (the same data is used for learning many times in internal processes of the neural network). The slower it is. Jump every 100. The maximum value is 10, the default is 1.
- **Split data to train&test** - for example, the entered value of 0.8 means that the input data for the network will be divided in the ratio 0.8 to learning, 0.2 for the tests of the network learned.
- **Data limit** - limits the amount of data downloaded from the source. It speeds up the processing, but reduces its quality.
- **Max probes** - limits the number of samples taken to learn the network. Samples are already aggregated according to the selected “Time frame” parameter. It speed up teaching but reduces its quality.
- **Build** - a button to start teaching the network. The button contains the number of required teaching courses. You should be careful and avoid one-time learning for more than 1000 courses. It is better to divide them into several smaller ones. One pass after a full data load take about 1-3 minutes on a 4 core 2.4.GHz server. **The module has implemented the best practices related to the number of neurons in individual hidden layers. The values suggested by the system are optimal from the point of view of these practices, but the user can decide on these values himself.**

Under the parameters for learning the network there is an area in which teaching results will appear.

After pressing the “Refresh” button, the list of the resulting models will be refreshed.

Autorefresh - selecting the field automatically refreshes the list of learning results every 10s.

The following information will be available in the table on the left:

- **Internal name** - the model name given by the system, including the user - specified prefix
- **Overall efficiency** - the network adjustment indicator - allow to see at a glance whether it is worth dealing with the model. The grater the value, the better.

After clicking on the table row, detailed data collected during the learning of the given model will be displayed. This data will be visible in the box on the right.

The selected model can be saved under its own name using the “Save algorithm” button. This saved algorithm will be available in the “Choose AI Rule” list when creating the rule (see Create AI Rule).

## 10.7 AI Learn Tasks

The “AI Learn Task” tab shows the list of processes initiated teaching the ANN network with the possibility of managing processes.

Each user can see only the process they run. The user in the role of Intelligence sees all running processes.

Logged in as : logserver

Create AI Rule AI Rules List AI Learn AI Learn Tasks

### +AI Learn Tasks

Algorithm prefix	Progress	Processing time	Actions
ko2_	16 / 2	1272	<span>Cancel</span> <span>Show</span>
rpa_ann_3	0 / 2	0	<span>Cancel</span> <span>Show</span> <span>Pause</span>
rpa_ann_1_	0 / 2	0	<span>Cancel</span> <span>Show</span> <span>Pause</span>
rpa_ann_2_	0 / 2	0	<span>Cancel</span> <span>Show</span>

Description of controls:

- **Algorithm prefix** - this is the value set by the user on the AI Learn screen in the Prefix name field
- **Progress** - here is the number of algorithms generated / the number of all to be generated
- **Processing time** - duration of algorithm generation in seconds (or maybe minutes or hours)
- **Actions:**
  - **Cancel** - deletes the algorithm generation task (user require confirmation of operation)
  - **Pause / Release** - pause / resume algorithm generation process.

AI Learn tab contain the Show in the preview mode of the ANN hyperparameters After completing the learning activity or after the user has interrupted it, the “Delete” button appears in “Action” field. This button allows you to permanently delete the learning results of a specific network.

Algorithm prefix	Progress	Processing time (s)	Actions
kk	0 / 4	0	<span>Show</span> <span>Delete</span>

## 10.8 Scenarios of using algorithms implemented in the Intelligence module

### 10.8.1 Teaching MLP networks and choosing the algorithm to use:

1. Go to the AI Learn tab,
2. We introduce the network teaching parameters,
3. Enter your own prefix for the names of the algorithms you have learned,
4. Press Build.
5. We observe the learned networks on the list (we can also stop the observation at any moment and go to other functions of the system. We will return to the learning results by going to the AI Learn Tasks tab and clicking the show action),
6. We choose the best model from our point of view and save it under our own name,
7. From this moment the algorithm is visible in the Create AI Rule tab.

### 10.8.2 Starting the MLP network algorithm:

1. Go to the Create AI Rule tab and create rules,
2. Select the previously saved model of the learned network,
3. Specify parameters visible on the screen (specific to MLP),
4. Press the Run button.

### 10.8.3 Starting regression algorithm:

1. Go to the Create AI Rule tab and create rules,
2. We choose AI Rule, e.g. Simple Moving Average, Linear Regression or Random Forest Regression, etc.,
3. Enter your own rule name (specific to regression),
4. Set the parameters of the rule ( specific to regression),
5. Press the Run button.

### 10.8.4 Management of available rules:

1. Go to the AI Rules List tab,
2. A list of AI rules available for our role is displayed,
3. We can perform the actions available on the right for each rule.# Results of algorithms #

The results of the “AI algorithms” are saved to the index „intelligence” specially created for this purpose. The index with the prediction result. These following fields are available in the index (where xxx is the name of the attribute being analyzed):

- **xxx\_pre** - estimate value
- **xxx\_cur** - current value at the moment of estimation

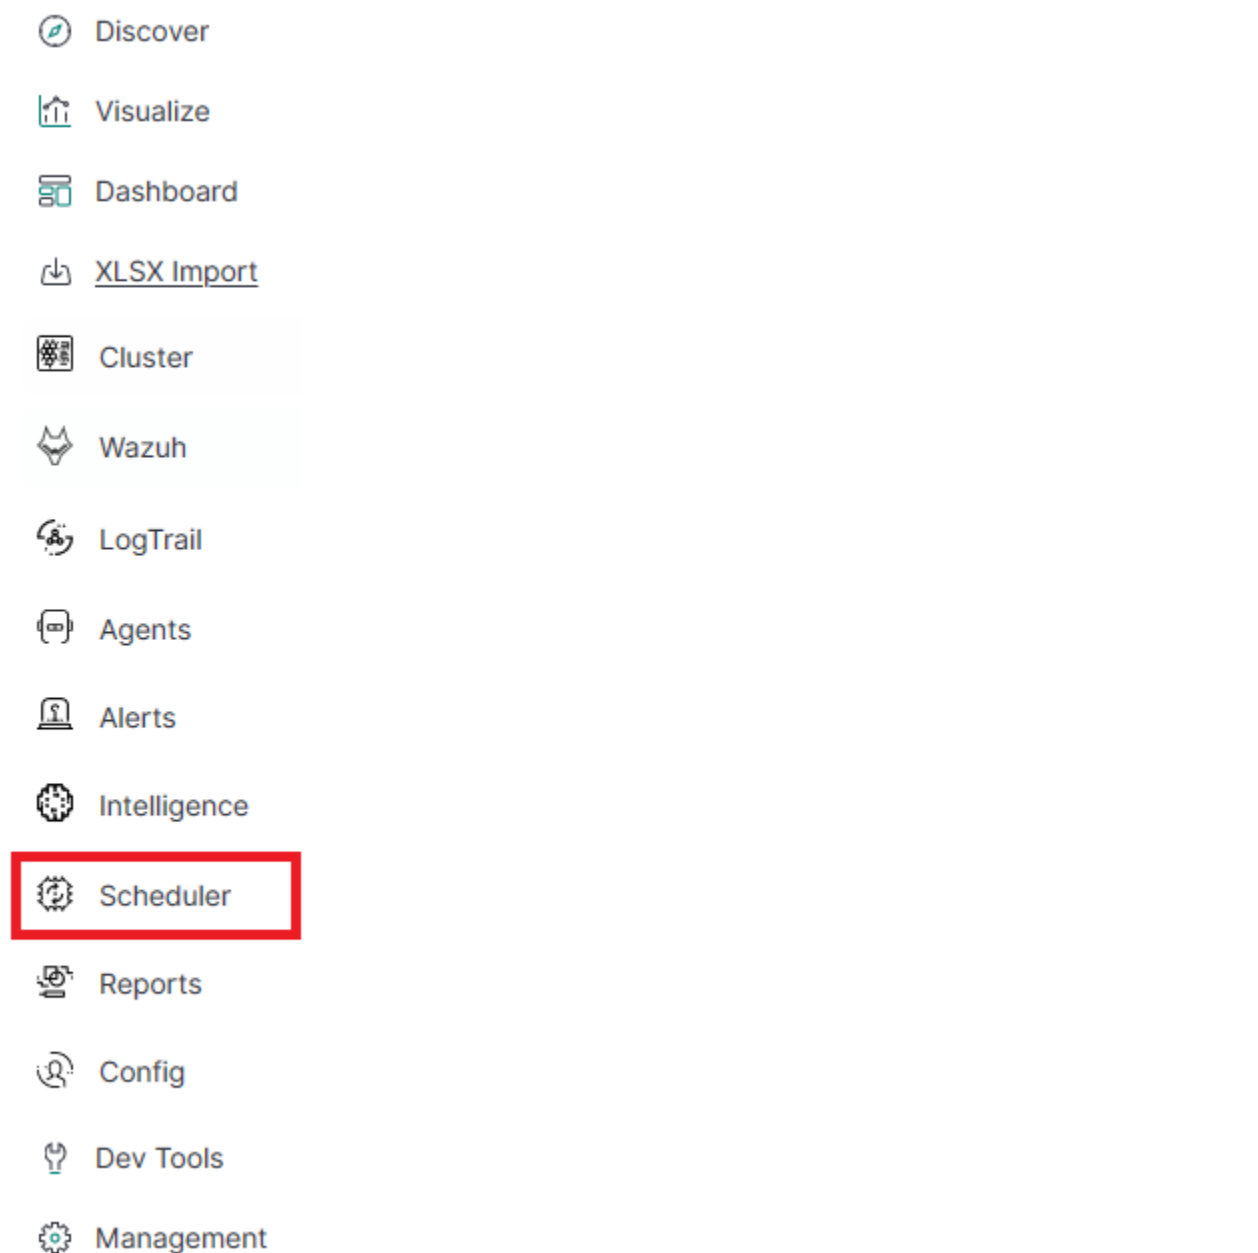

- **method\_name** - name of the algorithm used
- **rmse** - average square error for the analysis in which `_cur` values were available. **The smaller the value, the better.**
- **rmse\_normalized** - mean square error for the analysis in which `_cur` values were available, normalized with `_pre` values. **The smaller the value, the better.**
- **overall\_efficiency** - efficiency of the model. **The greater the value, the better. A value less than 0 may indicate too little data to correctly calculate the indicator**
- **linear\_function\_a** - directional coefficient of the linear function  $y = ax + b$ . **Only for the Trend and Linear Regression Trend algorithm**
- **linear\_function\_b** - the intersection of the line with the Y axis for the linear function  $y = ax + b$ . **Only for the Trend and Linear Regression Trend algorithm.**

Visualization and signals related to the results of data analysis should be created from this index. The index should be available to users of the Intelligence module.

## 10.9 Scheduler Module

Energy Logserver has a built-in task schedule. In this module, we can define a command or a list of commands whose execution we instruct the application in the form of tasks. We can determine the time and frequency of tasks. Tasks can contain a simple syntax, but they can also be associated with modules, e.g. with Intelligence module.

To go to the Scheduler window, select the tile icon from the main menu bar and then go to the „Scheduler” icon (To go back, go to the „Search” icon)

The page with three tabs will be displayed: Creating new tasks in the „Create Scheduler Job”, managing tasks in the „Job List” and checking the status of tasks in „Jobs Status”

In the window for creating new tasks we have a form consisting of fields:

- **Name** - in which we enter the name of the task
- **Cron Pattern** - a field in which in cron notation we define the time and frequency of the task
- **Command** - we give the syntax of the command that will be executed in this task. These can be simple system commands, but also complex commands related to the Intelligence module. In the task management window, we can activate /deactivate, delete and update the task by clicking on the selected icon for a given task

In the task status windows you can check the current status of the task: if it activated, when it started and when it ended, how long it took. This window is not editable and indicates historical data.

## 10.10 Permission

Permission have been implemented in the following way:

- Only the user in the admin role can create / update rules.
- When creating rules, the roles that will be able to enables / disengage / view the rules will be indicated.

We assume that the Learn process works as an administrator.

We assume that the visibility of Search in AI Learn is preceded by receiving the search permission in the module object permission.

The role of “Intelligence” launches the appropriate tabs.

An ordinary user only sees his models. The administrator sees all models.

## 10.11 Register new algorithm

For register new algorithm:

- **Login** to the Energy Logserver
- Select **Intelligence**
- Select **Algorithm**
- Fill Create algorithm form and press **Submit** button

Form fields:

Field	Description
Code	Short name <b>for</b> algorithm
Name	Algorithm name
Command	Command to execute. The command must be <b>in</b> the directory pointed to by <b>the parameter elastscheduler.commandpath.</b>

Energy Logserver execute command:

```
<command> <config> <error file> <out file>
```

Where:

- command - Command from command filed of Create algorithm form.
- config - Full path of json config file. The name of file is id of process status document in index `.intelligence_rules`
- error file - Unique name for error file. Not used by predefined algorithms.
- out file - Unique name for output file. Not used by predefined algorithms.

Config file:

## Verification steps and logs

## 11.1 Verification of Elasticsearch service

To verify of Elasticsearch service you can use following command:

- Control of the Elastisearch system service via **systemd**:

```
systemctl status elasticsearch
```

output:

```
elasticsearch.service - Elasticsearch
Loaded: loaded (/usr/lib/systemd/system/elasticsearch.service; disabled; ┐
↪ vendor preset: disabled)
Active: active (running) since Mon 2018-09-10 13:11:40 CEST; 22h ago
Docs: http://www.elastic.co
Main PID: 1829 (java)
CGroup: /system.slice/elasticsearch.service
└─1829 /bin/java -Xms4g -Xmx4g -XX:+UseConcMarkSweepGC -
↪ XX:CMSInitiatingOccupancyFraction=75 -XX:+UseCMSInitiatingOccupancyOnly -
↪ XX:+AlwaysPreTouch -Xss1m ...
```

- Control of Elasticsearch instance via **tcp port**:

```
curl -XGET '127.0.0.1:9200/'
```

output:

```
{
 "name" : "dY3RuYs",
 "cluster_name" : "elasticsearch",
 "cluster_uuid" : "EHZGAnJkStqlgRImqwzYQQ",
 "version" : {
 "number" : "6.2.3",
```

(continues on next page)

(continued from previous page)

```

 "build_hash" : "c59ff00",
 "build_date" : "2018-03-13T10:06:29.741383Z",
 "build_snapshot" : false,
 "lucene_version" : "7.2.1",
 "minimum_wire_compatibility_version" : "5.6.0",
 "minimum_index_compatibility_version" : "5.0.0"
 },
 "tagline" : "You Know, for Search"
}

```

- Control of Elasticsearch instance via **log file**:

```
tail -f /var/log/elasticsearch/elasticsearch.log
```

- other control commands via **curl** application:

```

curl -XGET "http://localhost:9200/_cat/health?v"
curl -XGET "http://localhost:9200/_cat/nodes?v"
curl -XGET "http://localhost:9200/_cat/indices?v"

```

## 11.2 Verification of Logstash service

To verify of Logstash service you can use following command:

- control Logstash service via **systemd**:

```
systemctl status logstash
```

output:

```

logstash.service - logstash
 Loaded: loaded (/etc/systemd/system/logstash.service; enabled; vendor_
 ↳ preset: disabled)
 Active: active (running) since Wed 2017-07-12 10:30:55 CEST; 1 months 23_
 ↳ days ago
 Main PID: 87818 (java)
 CGroup: /system.slice/logstash.service
 └─87818 /usr/bin/java -XX:+UseParNewGC -XX:+UseConcMarkSweepGC

```

- control Logstash service via **port tcp**:

```
curl -XGET '127.0.0.1:9600'
```

output:

```

{
 "host": "skywalker",
 "version": "4.5.3",
 "http_address": "127.0.0.1:9600"
}

```

- control Logstash service via **log file**:

```
tail -f /var/log/logstash/logstash-plain.log
```

## 11.2.1 Debugging

- dynamically update logging levels through the logging API (service restart not needed):

```
curl -XPUT 'localhost:9600/_node/logging?pretty' -H 'Content-Type: application/
↪json' -d'
{
 "logger.logstash.outputs.elasticsearch" : "DEBUG"
}
```

- permanent change of logging level (service need to be restarted):

- edit file `/etc/logstash/logstash.yml` and set the following parameter:

```
log.level: debug
```

- restart logstash service:

```
systemctl restart logstash
```

- checking correct syntax of configuration files:

```
/usr/share/logstash/bin/logstash -tf /etc/logstash/conf.d
```

- get information about load of the Logstash:

```
curl -XGET '127.0.0.1:9600/_node/jvm?pretty=true'
```

output:

```
{
 "host" : "logserver-test",
 "version" : "5.6.2",
 "http_address" : "0.0.0.0:9600",
 "id" : "5a440edc-1298-4205-a524-68d0d212cd55",
 "name" : "logserver-test",
 "jvm" : {
 "pid" : 14705,
 "version" : "1.8.0_161",
 "vm_version" : "1.8.0_161",
 "vm_vendor" : "Oracle Corporation",
 "vm_name" : "Java HotSpot(TM) 64-Bit Server VM",
 "start_time_in_millis" : 1536146549243,
 "mem" : {
 "heap_init_in_bytes" : 268435456,
 "heap_max_in_bytes" : 1056309248,
 "non_heap_init_in_bytes" : 2555904,
 "non_heap_max_in_bytes" : 0
 },
 "gc_collectors" : ["ParNew", "ConcurrentMarkSweep"]
 }
}
↪Logserver GUI service # # Verificatoin of Energy_
```

To verify of Energy Logserver GUI service you can use following command:

- control the Energy Logserver GUI service via **systemd**:

```
systemctl status kibana
```

output:

```
kibana.service - Kibana
 Loaded: loaded (/etc/systemd/system/kibana.service; disabled; vendor_
↳ preset: disabled)
 Active: active (running) since Mon 2018-09-10 13:13:19 CEST; 23h ago
 Main PID: 1330 (node)
 CGroup: /system.slice/kibana.service
 └─1330 /usr/share/kibana/bin/./node/bin/node --no-warnings /usr/
↳ share/kibana/bin/./src/cli -c /etc/kibana/kibana.yml
```

- control the Energy Logserver GUI via **port tcp/http**:

```
curl -XGET '127.0.0.1:5601/'
```

output:

```
<script>var hashRoute = '/app/kibana';
var defaultRoute = '/app/kibana';
var hash = window.location.hash;
if (hash.length) {
 window.location = hashRoute + hash;
} else {
 window.location = defaultRoute;
}</script>
```

- Control the Energy Logserver GUI via **log file**:

```
tail -f /var/log/messages
```

### 12.1 Node roles

Every instance of Elasticsearch server is called a *node*. A collection of connected nodes is called a *cluster*. All nodes know about all the other nodes in the cluster and can forward client requests to the appropriate node.

Besides that, each node serves one or more purpose:

- **Master-eligible node** - A node that has *node.master* set to true (default), which makes it eligible to be elected as the master node, which controls the cluster
- **Data node** - A node that has *node.data* set to true (default). Data nodes hold data and perform data related operations such as CRUD, search, and aggregations
- **Client node** - A client node has both *node.master* and *node.data* set to false. It can neither hold data nor become the master node. It behaves as a “*smart router*” and is used to forward cluster-level requests to the master node and data-related requests (such as search) to the appropriate data nodes
- **Tribe node** - A tribe node, configured via the *tribe.\** settings, is a special type of client node that can connect to multiple clusters and perform search and other operations across all connected clusters.

### 12.2 Naming convention

Elasticsearch require little configuration before before going into work.

The following settings must be considered before going to production:

- **path.data** and **path.logs** - default locations of these files are: `/var/lib/elasticsearch` and `/var/log/elasticsearch`.
- **cluster.name** - A node can only join a cluster when it shares its `cluster.name` with all the other nodes in the cluster. The default name is “`elasticsearch`”, but you should change it to an appropriate name which describes the purpose of the cluster. You can do this in `/etc/elasticsearch/elasticsearch.yml` file.

- **node.name** - By default, Elasticsearch will use the first seven characters of the randomly generated UUID as the node id. Node id is persisted and does not change when a node restarts. It is worth configuring a more human readable name: `node.name: prod-data-2` in file `/etc/elasticsearch/elasticsearch.yml`
- **network.host** - parametr specifying network interfaces to which Elasticsearch can bind. Default is `network.host: [ "_local_", "_site_" ]`.
- **discovery** - Elasticsearch uses a custom discovery implementation called “Zen Discovery”. There are two important settings:
  - `discovery.zen.ping.unicast.hosts` - specify list of other nodes in the cluster that are likely to be live and contactable;
  - `discovery.zen.minimum_master_nodes` - to prevent data loss, you can configure this setting so that each master-eligible node knows the minimum number of master-eligible nodes that must be visible in order to form a cluster.
- **heap size** - By default, Elasticsearch tells the JVM to use a heap with a minimum (Xms) and maximum (Xmx) size of 1 GB. When moving to production, it is important to configure heap size to ensure that Elasticsearch has enough heap available

## 12.3 Config files

To configure the Elasticsearch cluster you must specify some parameters in the following configuration files on every node that will be connected to the cluster:

- `/etc/elasticsearch/elasticsearch.yml`:
  - `cluster.name:name_of_the_cluster` - same for every node;
  - `node.name:name_of_the_node` - uniq for every node;
  - `node.master:true_or_false`
  - `node.data:true_or_false`
  - `network.host:["_local_", "_site_" ]`
  - `discovery.zen.ping.multicast.enabled`
  - `discovery.zen.ping.unicast.hosts`
- `/etc/elasticsearch/log4j2.properties`:
  - `logger: action: DEBUG` - for easier debugging.

## 12.4 Example setup

Example of the Elasticsearch cluster configuration:

- file `/etc/elasticsearch/elasticsearch.yml`:

```
cluster.name: tm-lab
node.name: "elk01"
node.master: true
node.data: true
network.host: 127.0.0.1,10.0.0.4
http.port: 9200
```

(continues on next page)

(continued from previous page)

```
discovery.zen.ping.multicast.enabled: false
discovery.zen.ping.unicast.hosts: ["10.0.0.4:9300", "10.0.0.5:9300", "10.0.0.
↪6:9300"]
```

- to start the Elasticsearch cluster execute command:

```
systemctl restart elasticsearch
```

- to check status of the Elasticsearch cluster execute command:
  - check of the Elasticsearch cluster nodes status via tcp port:

```
curl -XGET '127.0.0.1:9200/_cat/nodes?v'
```

host		ip	heap.percent	ram.percent	load	node.role	
↪master name							
10.0.0.4		10.0.0.4	18	91	0.00	-	
↪	-	elk01					
10.0.0.5		10.0.0.5	66	91	0.00	d	
↪	*	elk02					
10.0.0.6		10.0.0.6	43	86	0.65	d	
↪	m	elk03					
10.0.0.7		10.0.0.7	45	77	0.26	d	
↪	m	elk04					

- check status of the Elasticsearch cluster via log file:

```
tail -f /var/log/elasticsearch/tm-lab.log (cluster.name)
```

## 12.5 Adding a new node to existing cluster

Install the new Energy Logserver instance. The description of the installation can be found in the chapter “First configuration steps”

Change the following parameters in the configuration file:

- `cluster.name: name_of_the_cluster` same for every node;
- `node.name: name_of_the_node` uniq for every node;
- `node.master: true_or_false`
- `node.data: true_or_false`
- `discovery.zen.ping.unicast.hosts: ["10.0.0.4:9300", "10.0.0.5:9300", "10.0.0.6:9300"]` - IP addresses and instances of nodes in the cluster.

If you add a node with the role `data`, delete the contents of the `path.data` directory, by default in `/var/lib/elasticsearch`

Restart the Elasticsearch instance of the new node:

```
systemctl restart elasticsearch
```

# CHAPTER 13

## Integration with AD

You can configure the Energy Logserver to communicate with Active Directory to authenticate users. To integrate with Active Directory, you configure an Active Directory realm and assign Active Directory users and groups to the Energy Logserver roles in the role mapping file.

To protect passwords, communications between the Energy Logserver and the LDAP server should be encrypted using SSL/TLS. Clients and nodes that connect via SSL/TLS to the LDAP server need to have the LDAP server's certificate or the server's root CA certificate installed in their keystore or truststore.

### 13.1 AD configuration

The AD configuration should be done in the `/etc/elasticsearch/properties.yml` file.

Below is a list of settings to be made in the `properties.yml` file (the commented section in the file in order for the AD settings to start working, this fragment should be uncommented):

<code>**Directive**</code>	<code>**Description**</code>
<code>  # LDAP</code>	
<code>  #ldaps:</code>	
<code>  # - name: \"example.com\"</code>	<code>/# domain that is configured</code>
<code>  # host: \"127.0.0.1,127.0.0.2\"</code>	<code>/# list of server for this</code>
<code>domain</code>	
<code>  # port: 389</code>	<code>/# optional, default 389 for</code>
<code>unencrypted session or 636 for encrypted sessions</code>	
<code>  # ssl_enabled: false</code>	<code>/# optional, default true</code>
<code>  # ssl_trust_all_certs: true</code>	<code>/# optional, default false</code>

(continues on next page)

(continued from previous page)

```

|# ssl.keystore.file: \"path\" |# path to the truststore_
↪store |
|# ssl.keystore.password: \"path\" |# password to the trusted_
↪certificate store |
|# bind_dn: [admin@example.com] |# account name administrator_
↪ |
|# bind_password: \"password\" |# password for the_
↪administrator account |
|# search_user_base_DN: \"OU=lab,DC=example,DC=com\" |# search for the DN user_
↪tree database |
|# user_id_attribute: \"uid\" |# search for a user_
↪attribute optional, by default \"uid\" |
|# search_groups_base_DN: \"OU=lab,DC=example,DC=com\" |# group database search_
↪This is a catalog main, after which the groups will be sought.|
|# unique_member_attribute: \"uniqueMember\" |# optional, default\
↪\"uniqueMember\" |
|# connection_pool_size: 10 |# optional, default_
↪30 |
|# connection_timeout_in_sec: 10 |# optional, default_
↪1 |
|# request_timeout_in_sec: 10 |# optional, default_
↪1 |
|# cache_ttl_in_sec: 60 |# optional, default 0 -_
↪cache disabled |

```

If we want to configure multiple domains, then in this configuration file we copy the # LDAP section below and configure it for the next domain.

Below is an example of how an entry for 2 domains should look like. (It is important to take the interpreter to read these values correctly).

```

ldaps:
- name: "example1.com"
 host: "127.0.0.1,127.0.0.2"
 port: 389 # optional, default 389
 ssl_enabled: false # optional, default true
 ssl_trust_all_certs: true # optional, default false
 bind_dn: "admin@example1.com"
 bind_password: "password" # generate encrypted password with /usr/share/
↪elasticsearch/pass-encrypter/pass-encrypter.sh
 search_user_base_DN: "OU=lab,DC=example1,DC=com"
 user_id_attribute: "uid" # optional, default "uid"
 search_groups_base_DN: "OU=lab,DC=example1,DC=com"
 unique_member_attribute: "uniqueMember" # optional, default "uniqueMember"
 connection_pool_size: 10 # optional, default 30
 connection_timeout_in_sec: 10 # optional, default 1
 request_timeout_in_sec: 10 # optional, default 1
 cache_ttl_in_sec: 60 # optional, default 0 - cache disabled
 service_principal_name: "esauth@example1.com" # optional, for sso
 service_principal_name_password: "password" # optional, for sso
- name: "example2.com" #DOMAIN 2
 host: "127.0.0.1,127.0.0.2"
 port: 389 # optional, default 389
 ssl_enabled: false # optional, default true
 ssl_trust_all_certs: true # optional, default false
 bind_dn: "admin@example2.com"
 bind_password: "password" # generate encrypted password with /usr/share/
↪elasticsearch/pass-encrypter/pass-encrypter.sh

```

(continues on next page)

(continued from previous page)

```

search_user_base_DN: "OU=lab,DC=example2,DC=com"
user_id_attribute: "uid" # optional, default "uid"
search_groups_base_DN: "OU=lab,DC=example2,DC=com"
unique_member_attribute: "uniqueMember" # optional, default "uniqueMember"
connection_pool_size: 10 # optional, default 30
connection_timeout_in_sec: 10 # optional, default 1
request_timeout_in_sec: 10 # optional, default 1
cache_ttl_in_sec: 60 # optional, default 0 - cache disabled
service_principal_name: "esauth@example2.com" # optional, for sso
service_principal_name_password : "password" # optional, for ssl

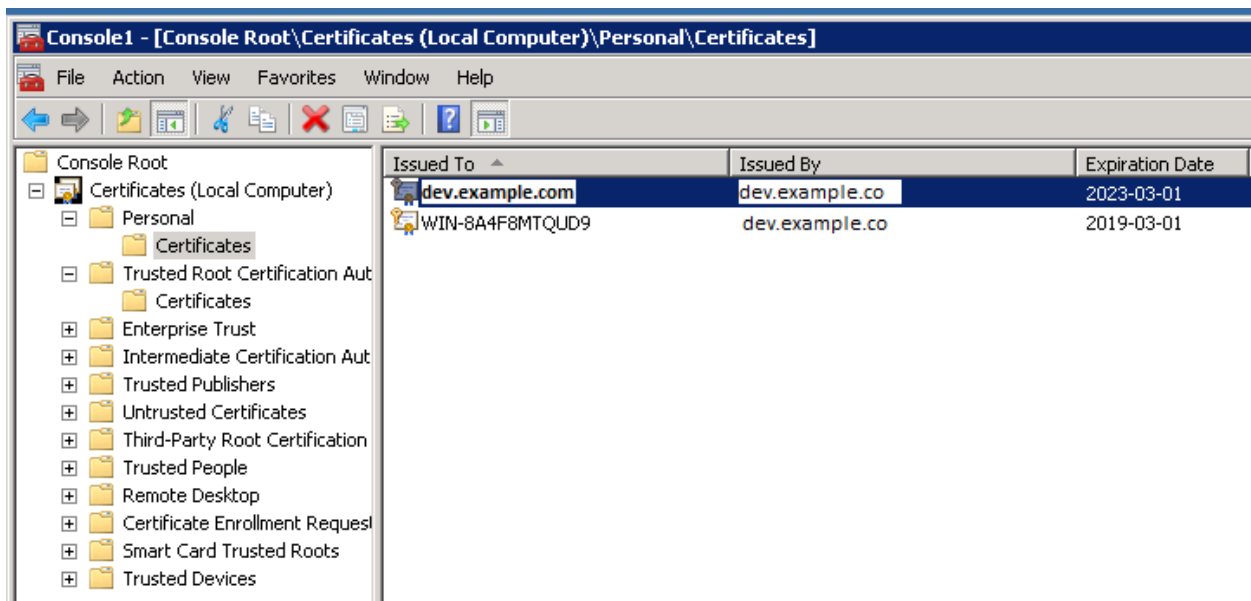

```

After completing the LDAP section entry in the `properties.yml` file, save the changes and restart the service with the command:

```
systemctl restart elasticsearch
```

## 13.2 Configure SSL support for AD authentication

Open the certificate manager on the AD server.

Select the certificate and open it

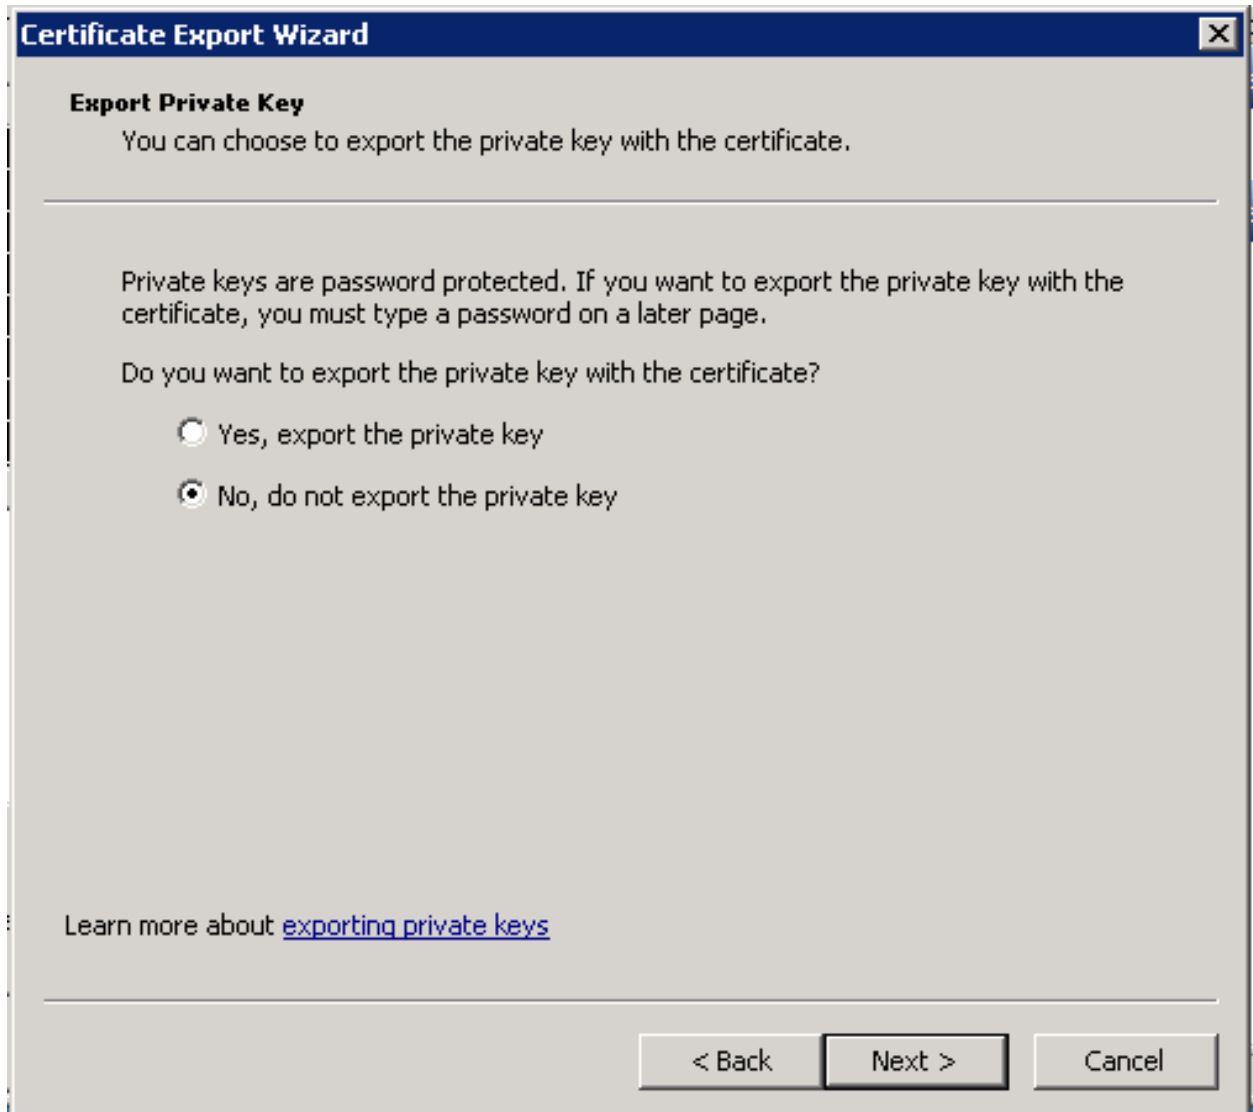

Select the option of copying to a file in the Details tab

Click the Next button

Keep the setting as shown below and click Next

Keep the setting as shown below and click Next.

Give the name a certificate

After the certificate is exported, this certificate should be imported into a trusted certificate file that will be used by the Elasticsearch plugin.

To import a certificate into a trusted certificate file, a tool called „keytool.exe” is located in the JDK installation directory.

Use the following command to import a certificate file:

```
keytool -import -alias adding_certificate_keystore -file certificate.cer -keystore_
↪certificatestore
```

The values for RED should be changed accordingly.

By doing this, he will ask you to set a password for the trusted certificate store. Remember this password, because it must be set in the configuration of the Elasticsearch plugin. The following settings must be set in the `properties.yml` configuration for SSL:

```
ssl.keystore.file: "<path to the trust certificate store>"
ssl.keystore.password: "< password to the trust certificate store>"
```

## 13.3 Role mapping

In the `/etc/elasticsearch/properties.yml` configuration file you can find a section for configuring role mapping:

```
LDAP ROLE MAPPING FILE`
rolemapping.file.path: /etc/elasticsearch/role-mappings.yml
```

This variable points to the file `/etc/elasticsearch/role-mappings.yml` Below is the sample content for this file:

```
admin:
"CN=Admins,OU=lab,DC=dev,DC=it,DC=example,DC=com"
bank:
"CN=security,OU=lab,DC=dev,DC=it,DC=example,DC=com"
```

**Attention.** The role you define in the `role-mappings` file must be created in the Energy Logserver.

How to the mapping mechanism works ? An AD user log in to Energy Logserver. In the application there is a admin role, which through the file `role-mapping.yml` binds to the name of the admin role to which the Admins container from AD is assigned. It is enough for the user from the AD account to log in to the application with the privileges that are assigned to admin role in the Energy Logserver. At the same time, if it is the first login in the Energy Logserver, an account is created with an entry that informs the application administrator that it was created by logging in with AD.

Similar, the mechanism will work if we have a role with an arbitrary name created in Energy Logserver Logistics and connected to the name of the `role-mappings.yml` and existing in AD any container.

Below a screenshot of the console on which are marked accounts that were created by users logging in from AD

User Management   Settings   License Info				
Create User	User List	Create Role	Role List	Objects Permission
Username	Roles	Default Role	Email	Actions
alert	admin			 
intelligence	admin			 
logserver	admin			 
logstash	logstash			 
scheduler	admin			 
user1@example.com	adrole	adrole		 
user2@example.com	adrole	adrole		 

If you map roles with from several domains, for example `dev.example1.com`, `dev.example2.com` then in User List we will see which user from which domain with which role logged in Energy Logserver.

## 13.4 Password encryption

For security reason you can provide the encrypted password for Active Directory integration. To do this use `pass-encrypter.sh` script that is located in the `Utils` directory in installation folder.

1. Installation of `pass-encrypter`

```
cp -pr /instalation_folder/elasticsearch/pass-en00
```

000crypter /usr/share/elasticsearch/

## 2. Use *pass-encrypter*

```
/usr/share/elasticsearch/pass-encrypter/pass-encrypter.sh
Enter the string for encryption :
new_password
Encrypted string : MTU1MTEwMDcxMzQzMg==1GEG8KUOgyJko0PuT2C4uw==
```

---

## Integration with Radius

---

To use the Radius protocol, install the latest available version of Energy Logserver.

### 14.1 Configuration

The default configuration file is located at `/etc/elasticsearch/properties.yml`:

```
Radius opts
#radius.host: "10.4.3.184"
#radius.secret: "querty1q2ww2q1"
#radius.port: 1812
```

Use appropriate secret based on config file in Radius server. The secret is configured on `clients.conf` in Radius server.

In this case, since the plugin will try to do Radius auth then client IP address should be the IP address where the Elasticsearch is deployed.

Every user by default at present get the admin role.

---

## Integration with LDAP

---

To use OpenLDAP authorization, install or update Energy Logserver 7.0.2.

### 15.1 Configuration

The default configuration file is located at `/etc/elasticsearch/properties.yml`:

- `ldap_groups_search` - Enable Open LDAP authorization. The `ldap_groups_search` switch with `true` / `false` values.
- `search_filter` - you can define `search_filter` for each domain. When polling the LDAP / AD server, the placeholder is changed to `userId` (everything before `@domain`) of the user who is trying to login. Sample `search_filter`:

```
search_filter: "(&(objectClass=inetOrgPerson)(cn=%s))"
```

If no `search_filter` is given, the default will be used:

```
(&(&(objectCategory=Person)(objectClass=User))(samaccountname=%s))
```

- `max_connections` - for each domain (must be  $\geq 1$ ), this is the maximum number of connections that will be created with the LDAP / AD server for a given domain. Initially, one connection is created, if necessary another, up to the maximum number of connections set. If `max_connections` is not given, the default value = 10 will be used.
- `ldap_groups_search` - filter will be used to search groups on the AD / LDAP server of which the user is trying to login. An example of `groups_search_filter` that works quite universally is:

```
groups_search_filter: "(|(uniqueMember=%s)(member=%s))"
```

Sample configuration:

```
licenseFilePath: /usr/share/elasticsearch/

ldaps:
 - name: "dev.it.example.com"
 host: "192.168.0.1"
 port: 389 # optional,
 ↪default 389
 #ssl_enabled: false # optional,
 ↪default true
 #ssl_trust_all_certs: true # optional,
 ↪default false
 bind_dn: "Administrator@dev2.it.example.com"
 bind_password: "Buspa#mexaj1"
 search_user_base_DN: "OU=lab,DC=dev,DC=it,DC=example,DC=pl"
 search_filter: "(&(objectClass=inetOrgperson)(cn=%s))" # optional,
 ↪default "(&(&(objectCategory=Person)(objectClass=User))(samaccountname=%s))"
 user_id_attribute: "uid" # optional,
 ↪default "uid"
 search_groups_base_DN: "OU=lab,DC=dev,DC=it,DC=example,DC=pl" # base DN,
 ↪which will be used for searching user's groups in LDAP tree
 groups_search_filter: "(member=%s)" # optional,
 ↪default (member=%s), if ldap_groups_search is set to true, this filter will be
 ↪used for searching user's membership of LDAP groups
 ldap_groups_search: false # optional,
 ↪default false - user groups will be determined basing on user's memberOf
 ↪attribute
 unique_member_attribute: "uniqueMember" # optional,
 ↪default "uniqueMember"
 max_connections: 10 # optional,
 ↪default 10
 connection_timeout_in_sec: 10 # optional,
 ↪default 1
 request_timeout_in_sec: 10 # optional,
 ↪default 1
 cache_ttl_in_sec: 60 # optional,
 ↪default 0 - cache disabled
```

When the password is longer than 20 characters, we recommend using our pass-encrypter, otherwise backslash must be escaped with another backslash. Endpoint `role-mapping/_reload` has been changed to `_role-mapping/reload`. This is a unification of API conventions, in accordance with Elasticsearch conventions.

---

## Configuring Single Sign On (SSO)

---

In order to configure SSO, the system should be accessible by domain name URL, not IP address nor localhost.

**Ok :** `https://loggui.com:5601/login`. **Wrong :** `https://localhost:5601/login`, `https://10.0.10.120:5601/login`

In order to enable SSO on your system follow below steps. The configuration is made for AD: `dev.example.com`, GUI URL: `loggui.com`

### 16.1 Configuration steps

#### 1. Create an User Account for Elasticsearch auth plugin

In this step, a Kerberos Principal representing Elasticsearch auth plugin is created on the Active Directory. The principal name would be `name@DEV.EXAMPLE.COM`, while the `DEV.EXAMPLE.COM` is the administrative name of the realm. In our case, the principal name will be `esauth@DEV.EXAMPLE.COM`.

Create User in AD. Set “Password never expires” and “Other encryption options” as shown below:

### 1. Define Service Principal Name (SPN) and Create a Keytab file for it

Use the following command to create the keytab file and SPN:

```
C:> ktpass -out c:\Users\Administrator\esauth.keytab -princ HTTP/loggui.com@DEV.EXAMPLE.COM
-mapUser esauth -mapOp set -pass 'Sprint$123' -crypto ALL -pType KRB5_NT_PRINCIPAL
```

Values highlighted in bold should be adjusted for your system. The `esauth.keytab` file should be placed on your elasticsearch node - preferably `/etc/elasticsearch/` with read permissions for elasticsearch user: `chmod 640 /etc/elasticsearch/esauth.keytab chown elasticsearch: /etc/elasticsearch/esauth.keytab`

### 1. Create a file named `krb5Login.conf`:

```
com.sun.security.jgss.initiate{
 com.sun.security.auth.module.Krb5LoginModule required
 principal="esauth@DEV.EXAMPLE.COM" useKeyTab=true
 keyTab=/etc/elasticsearch/esauth.keytab storeKey=true debug=true;
};
com.sun.security.jgss.krb5.accept {
 com.sun.security.auth.module.Krb5LoginModule required
 principal="esauth@DEV.EXAMPLE.COM" useKeyTab=true
 keyTab=/etc/elasticsearch/esauth.keytab storeKey=true debug=true;
};
```

Principal user and keyTab location should be changed as per the values created in the step 2. Make sure the domain is in UPPERCASE as shown above. The `krb5Login.conf` file should be placed on your elasticsearch node, for instance `/etc/elasticsearch/` with read permissions for elasticsearch user:

```
sudo chmod 640 /etc/elasticsearch/krb5Login.conf
sudo chown elasticsearch: /etc/elasticsearch/krb5Login.conf
```

### 1. Append the following JVM arguments (on Elasticsearch node in `/etc/sysconfig/elasticsearch`)

```
-Dsun.security.krb5.debug=true -Djava.security.krb5.realm=DEV.EXAMPLE.COM
-Djava.security.krb5.kdc=AD_HOST_IP_ADDRESS -Djava.security.auth.login.config=/etc/elasticsearch/krb5Login.conf
-Djavax.security.auth.useSubjectCredsOnly=false
```

Change the appropriate values in the bold. This JVM arguments has to be set for Elasticsearch server.

1. Add the following additional (sso.domain, service\_principal\_name, service\_principal\_name\_password) settings for ldap in elasticsearch.yml or properties.yml file wherever the ldap settings are configured:

```
sso.domain: "dev.example.com"
ldaps:
- name: "dev.example.com"
 host: "IP_address"
 port: 389 # optional, default 389
 ssl_enabled: false # optional, default
 ↪ true
 ssl_trust_all_certs: false # optional, default
 ↪ false
 bind_dn: "Administrator@dev.example.com" # optional, skip for
 ↪ anonymous bind
 bind_password: "administrator_password" #
 ↪ optional, skip for anonymous bind
 search_user_base_DN: "OU=lab,DC=dev,DC=it,DC=example,DC=com"
 user_id_attribute: "uid" # optional, default "uid"
 ↪ "
 search_groups_base_DN: "OU=lab,DC=dev,DC=it,DC=example,DC=com"
 unique_member_attribute: "uniqueMember" # optional, default
 ↪ "uniqueMember"
 service_principal_name: "esauth@DEV.EXAMPLE.COM"
 service_principal_name_password : "Sprint$123"
```

Note: At this moment, SSO works for only single domain. So you have to mention for what domain SSO should work in the above property sso.domain

1. To apply the changes restart Elasticsearch service

```
sudo systemctl restart elasticsearch.service
```

2. Enable SSO feature in kibana.yml file:

```
kibana.sso_enabled: true
```

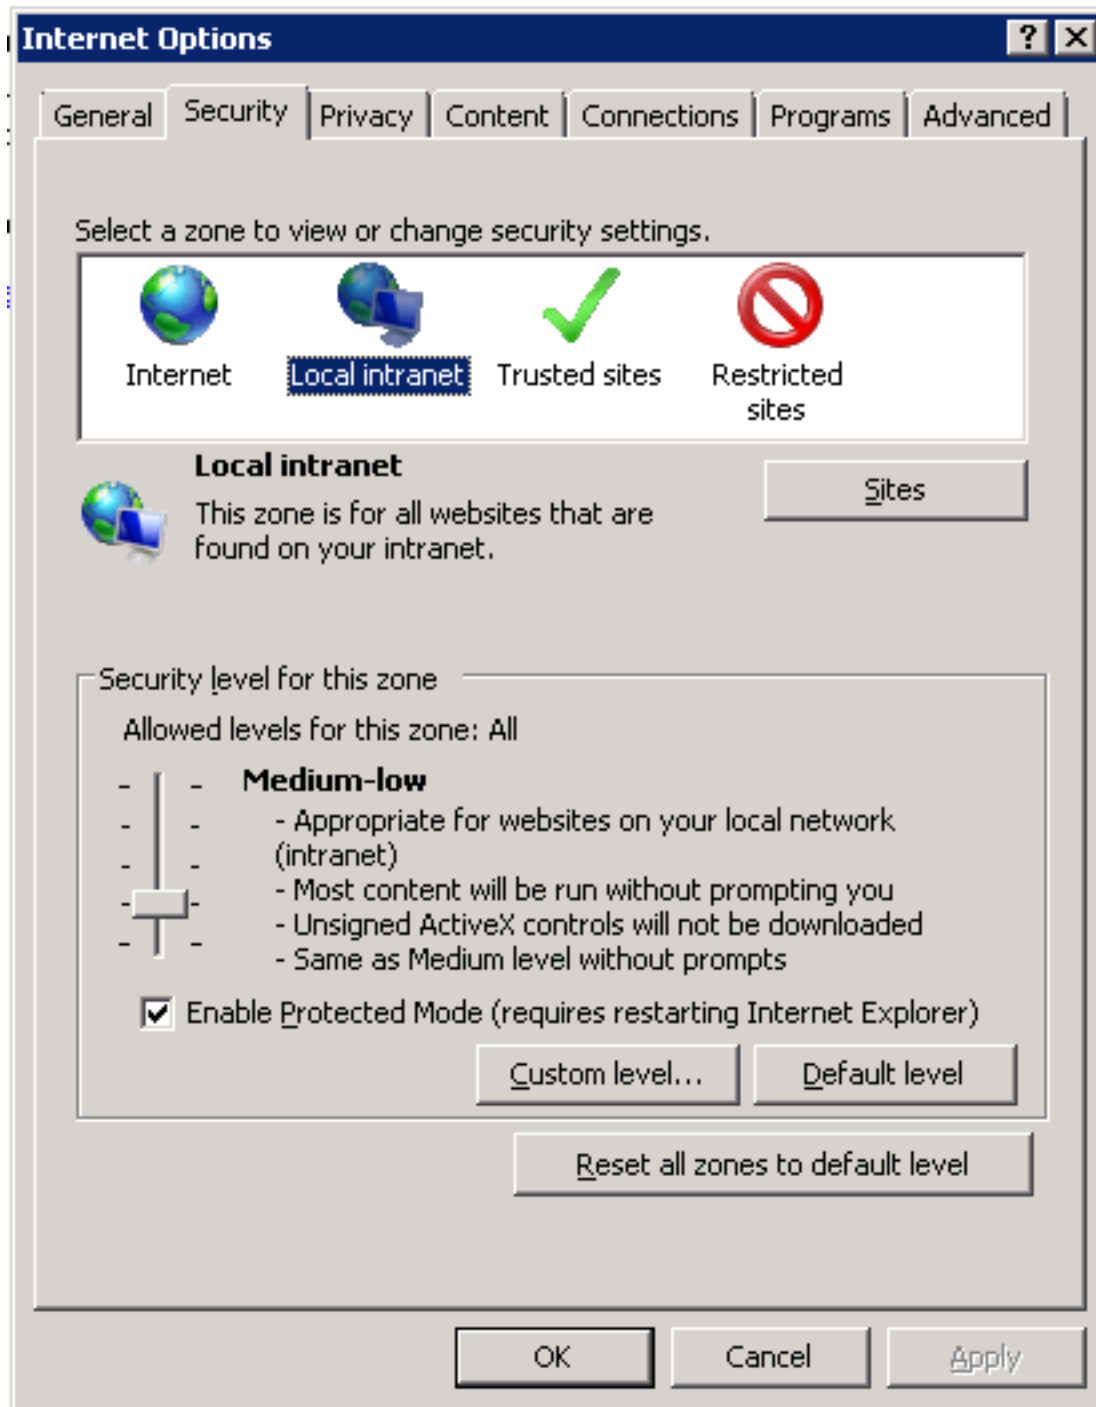

3. After that Kibana has to be restarted: \

```
sudo systemctl restart kibana.service
```

## 16.2 Client (Browser) Configuration##

### 16.2.1 Internet Explorer configuration

1. Goto Internet Options from Tools menu and click on Security Tab:

1. Select Local intranet, click on Site -> Advanced -> Add the url:

After adding the site click close.

1. Click on custom level and select the option as shown below:

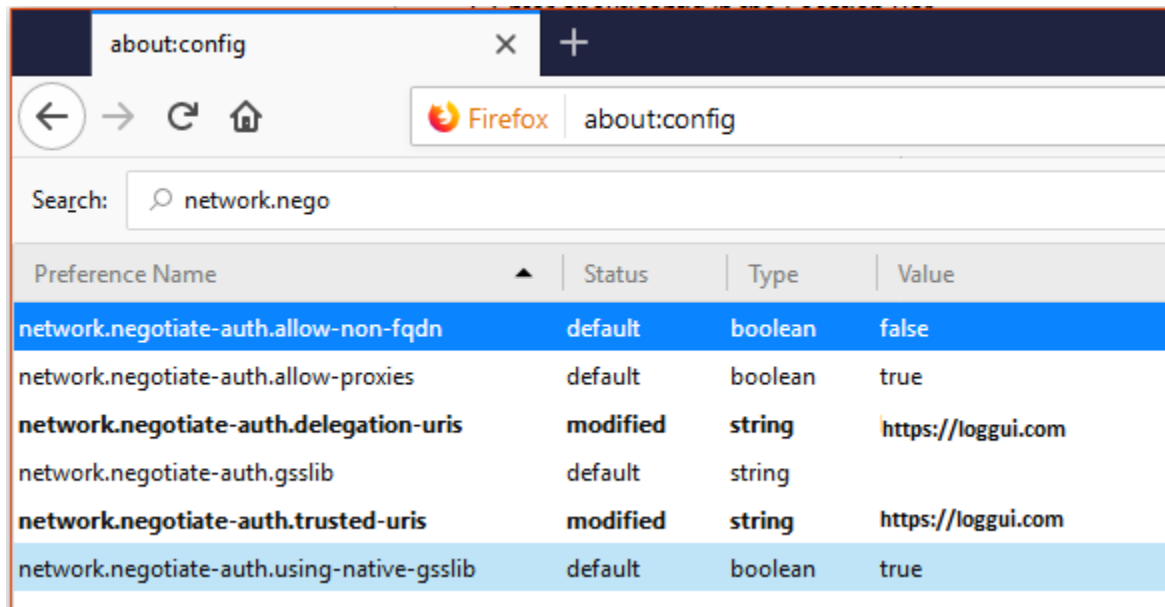

### 16.2.2 Chrome configuration

For Chrome, the settings are taken from IE browser.

### 16.2.3 Firefox configuration

Update the following config:

## Configure email delivery

## 17.1 Configure email delivery for sending PDF reports in Scheduler.

The default e-mail client that installs with the Linux CentOS system, which is used by Energy Logserver to send reports (Section 5.3 of the [Reports](#) chapter), is *postfix*.# Configuration file for *postfix* mail client #

The *postfix* configuration directory for CentOS is */etc/postfix*. It contains files:

**main.cf** - the main configuration file for the program specifying the basics parameters

Some of its directives:

<b>**Directive**</b>	<b>**Description**</b>
queue\_directory	The postfix queue location.
command\_directory	The location of Postfix commands.
daemon\_directory	Location of Postfix daemons.
mail\_owner	The owner of Postfix domain name of the server
myhostname	The fully qualified domain name of the server.
mydomain	Server domain
myorigin	Host <b>or</b> domain to be displayed <b>as</b> origin on email
→leaving the server.	
inet\_interfaces	Network interface to be used <b>for</b> incoming email.
mydestination	Domains <b>from which</b> the server accepts mail.
mynetworks	The IP address of trusted networks.
relayhost	Host <b>or</b> other mail server through which mail will
→be sent. This server will act <b>as</b> an outbound gateway.	
alias\_maps	Database of asliases used by the local delivery
→agent.	
alias\_database	Alias database generated by the new aliases
→command.	
mail\_spool\_directory	The location where user boxes will be stored.

**master.cf** - defines the configuration settings for the master daemon and the way it should work with other agents to deliver mail. For each service installed in the master.cf file there are seven columns that define how the service should be used.

Column	Description
service	The name of the service
type	The transport mechanism to be user.
private	Is the service only <b>for</b> user by Postfix.
unpriv	Can the service be run by ordinary users
chroot	Whether the service <b>is</b> to change the main directory (chroot) <b>for</b> the mail. Queue.
wakeup	Wake up interval <b>for</b> the service.
maxproc	The maximum number of processes on which the service can be <b>forked</b> (to divide <b>in</b> branches)
command + args	A command associated <b>with</b> the service plus <b>any</b> argument

**access** - can be used to control access based on e-mail address, host address, domain or network address.

*Examples of entries in the file*

Description	Example
To allow access <b>for</b> specific IP address:	192.168.122.20 OK
To allow access <b>for</b> a specific domain:	example.com OK
To deny access <b>from the</b> 192.168.3.0/24 network:	192.168.3 REJECT

After making changes to the access file, you must convert its contents to the access.db database with the postmap command:

```
postmap /etc/postfix/access
ll /etc/postfix/access*

-rw-r--r--. 1 root root 20876 Jan 26 2014 /etc/postfix/access
-rw-r--r--. 1 root root 12288 Feb 12 07:47 /etc/postfix/access.db
```

**canonical** - mapping incoming e-mails to local users.

*Examples of entries in the file:*

To forward emails to user1 to the [[user1@yahoo.com] mailbox:

```
user1 user1\@yahoo.com
```

To forward all emails for example.org to another example.com domain:

```
@example.org @example.com
```

After making changes to the canonical file, you must convert its contents to the canonical.db database with the postmap command:

```
postmap /etc/postfix/canonical
ll /etc/postfix/canonical*

-rw-r--r--. 1 root root 11681 2014-06-10 /etc/postfix/canonical
-rw-r--r--. 1 root root 12288 07-31 20:56 /etc/postfix/canonical.db
```

**generic** - mapping of outgoing e-mails to local users. The syntax is the same as a canonical file. After you make change to this file, you must also run the postmap command.

```
postmap /etc/postfix/generic
ll /etc/postfix/generic*

-rw-r--r--. 1 root root 9904 2014-06-10 /etc/postfix/generic
-rw-r--r--. 1 root root 12288 07-31 21:15 /etc/postfix/generic.db
```

**relocated** – information about users who have been transferred. The syntax of the file is the same as canonical and generic files.

Assuming tha user1 was moved from example.com to example.net, you can forward all emails received on the old address to the new address:

Example of an entry in the file:

```
user1@example.com user1@example.net
```

After you make change to this file, you must also run the postmap command.

```
postmap /etc/postfix/relocated
ll /etc/postfix/relocated*

-rw-r--r--. 1 root root 6816 2014-06-10 /etc/postfix/relocated
-rw-r--r--. 1 root root 12288 07-31 21:26 /etc/postfix/relocated.d
```

**transport** – mapping between e-mail addresses and server through which these e-mails are to be sent (next hops) int the transport format: nexthop.

Example of an entry in the file:

```
user1@example.com smtp:host1.example.com
```

After you make changes to this file, you must also run the postmap command.

```
postmap /etc/postfix/transport
[root@server1 postfix]# ll /etc/postfix/transport*

-rw-r--r--. 1 root root 12549 2014-06-10 /etc/postfix/transport
-rw-r--r--. 1 root root 12288 07-31 21:32 /etc/postfix/transport.db
```

**virtual** - user to redirect e-mails intended for a certain user to the account of another user or multiple users. It can also be used to implement the domain alias mechanism.

*Examples of the entry in the file:*

Redirecting email for user1, to root users and user3:

```
user1 root, user3
```

Redirecting email for user 1 in the example.com domain to the root user:

```
user1@example.com root
```

After you make change to this file, you must also run the postmap command:

```
postmap /etc/postfix/virtual
ll /etc/postfix/virtual
```

(continues on next page)

(continued from previous page)

```
-rw-r--r--. 1 root root 12494 2014-06-10 /etc/postfix/virtual
-rw-r--r--. 1 root root 12288 07-31 21:58 /etc/postfix/virtual.db
```

## 17.2 Basic *postfix* configuration

Base configuration of *postfix* application you can make in `/etc/postfix/main.cfg` configuration file, which must complete with the following entry:

- section *# RECEIVING MAIL*

```
inet_interfaces = all
inet_protocols = ipv4
```

- section *# INTERNET OR INTRANET*

```
relayhost = [IP mail server]:25 (port number)
```

In the netx step you must complete the canonical file of *postfix*

At the end you should restart the *postfix*:

```
systemctl restart postfix
```

## 17.3 Example of postfix configuration with SSL encryption enabled

To configure email delivery with SSL encryption you need to make the following changes in the *postfix* configuration files:

- **`/etc/postfix/main.cf`** - file should contain the following entries in addition to standard (unchecked entries):

```
mydestination = $myhostname, localhost.$mydomain, localhost
myhostname = example.com
relayhost = [smtp.example.com]:587
smtp_sasl_auth_enable = yes
smtp_sasl_password_maps = hash:/etc/postfix/sasl_passwd
smtp_sasl_security_options = noanonymous
smtp_tls_CAfile = /root/certs/cacert.cer
smtp_use_tls = yes
smtp_sasl_mechanism_filter = plain, login
smtp_sasl_tls_security_options = noanonymous
canonical_maps = hash:/etc/postfix/canonical
smtp_generic_maps = hash:/etc/postfix/generic
smtpd_recipient_restrictions = permit_sasl_authenticated
```

- **`/etc/postfix/sasl/passwd`** - file should define the data for authorized

```
[smtp.example.com]:587 [[USER@example.com:PASS]] (mailto:USER@example.
↪com:PASS)
```

You need to give appropriate permissions:

```
chmod 400 /etc/postfix/sasl_passwd
```

and map configuration to database:

```
postmap /etc/postfix/sasl_passwd
```

next you need to generate a ca cert file:

```
cat /etc/ssl/certs/Example_Server_CA.pem | tee -a etc/postfix/cacert.pem
```

And finally, you need to restart postfix

```
/etc/init.d/postfix restart
```

## 18.1 Kibana API

The Kibana dashboard import/export APIs allow people to import dashboards along with all of their corresponding saved objects such as visualizations, saved searches, and index patterns.

### 18.1.1 Kibana Import API

Request:

```
POST /api/kibana/dashboards/import
```

Query Parameters:

- **force** (optional)  
(boolean) Overwrite any existing objects on id conflict
- **exclude** (optional)  
(array) Saved object types that should not be imported

Example:

```
curl -X POST "https://user:password@localhost:5601POST api/kibana/dashboards/import?
→exclude=index-pattern"
```

### 18.1.2 Kibana Export API

Request:

```
GET /api/kibana/dashboards/export
```

### Query Parameters

- dashboard (required)  
(array|string) The id(s) of the dashboard(s) to export

Example:

```
curl -k -XPOST "https://user:password@localhost:443/api/kibana/dashboards/import?
↪force=true&exclude=index-pattern" -H 'kbn-xsrf: true' -H 'Content-Type: application/
↪json' -d@dashboard.json
```

## 18.2 Elasticsearch API

The Elasticsearch has a typical REST API and data is received in JSON format after the HTTP protocol. By default the tcp/9200 port is used to communicate with the Elasticsearch API. For purposes of examples, communication with the Elasticsearch API will be carried out using the *curl* application.

Program syntax:

```
curl -XGET -u login:password '127.0.0.1:9200'
```

Available methods:

- PUT - sends data to the server;
- POST - sends a request to the server for a change;
- DELETE - deletes the index / document;
- GET - gets information about the index /document;
- HEAD - is used to check if the index / document exists.

Available APIs by roles:

- Index API - manages indexes;
- Document API - manages documents;
- Cluster API - manage the cluster;
- Search API - is used to search for data.

## 18.3 Elasticsearch Index API

The indices APIs are used to manage individual indices, index settings, aliases, mappings, and index templates.

### 18.3.1 Adding Index

*Adding Index* - automatic method:

```
curl -XPUT -u login:password '127.0.0.1:9200/twitter/tweet/1?pretty=true' -d'{
 "user" : "elk01",
 "post_date" : "2017-09-05T10:00:00",
 "message" : "tests auto index generation"
}'
```

You should see the output:

```
{
 "_index" : "twitter",
 "_type" : "tweet",
 "_id" : "1",
 "_version" : 1,
 "_shards" : {
 "total" : 2,
 "successful" : 1,
 "failed" : 0
 },
 "created" : true
}
```

The parameter `action.auto_create_index` must be set on `true`.

**Adding Index** – manual method:

- settings the number of shards and replicas:

```
curl -XPUT -u login:password '127.0.0.1:9200/twitter2?pretty=true' -d'{
 "settings" : {
 "number_of_shards" : 1,
 "number_of_replicas" : 1
 }
}'
```

You should see the output:

```
{
 "acknowledged" : true
}
```

- command for manual index generation:

```
curl -XPUT -u login:password '127.0.0.1:9200/twitter2/tweet/1?pretty=true' -d'{
 "user" : "elk01",
 "post_date" : "2017-09-05T10:00:00",
 "message" : "tests manual index generation"
}'
```

You should see the output:

```
{
 "_index" : "twitter2",
 "_type" : "tweet",
 "_id" : "1",
 "_version" : 1,
 "_shards" : {
 "total" : 2,
 "successful" : 1,
 "failed" : 0
 },
 "created" : true
}
```

### 18.3.2 Delete Index

**Delete Index** - to delete *twitter* index you need use the following command:

```
curl -XDELETE -u login:password '127.0.0.1:9200/twitter?pretty=true'
```

The delete index API can also be applied to more than one index, by either using a comma separated list, or on all indices by using `_all` or `*` as index:

```
curl -XDELETE -u login:password '127.0.0.1:9200/twitter*?pretty=true'
```

To allowing to delete indices via wildcards set `action.destructive_requires_name` setting in the config to `false`.

### 18.3.3 API useful commands

- get information about Replicas and Shards:

```
curl -XGET -u login:password '127.0.0.1:9200/twitter/_settings?pretty=true'
```

```
curl -XGET -u login:password '127.0.0.1:9200/twitter2/_settings?pretty=true'
```

- get information about mapping and alias in the index:

```
curl -XGET -u login:password '127.0.0.1:9200/twitter/_mappings?pretty=true'
```

```
curl -XGET -u login:password '127.0.0.1:9200/twitter/_aliases?pretty=true'
```

- get all information about the index:

```
curl -XGET -u login:password '127.0.0.1:9200/twitter?pretty=true'
```

- checking does the index exist:

```
curl -XGET -u login:password '127.0.0.1:9200/twitter?pretty=true'
```

- close the index:

```
curl -XPOST -u login:password '127.0.0.1:9200/twitter/_close?pretty=true'
```

- open the index:

```
curl -XPOST -u login:password '127.0.0.1:9200/twitter/_open?pretty=true'
```

- get the status of all indexes:

```
curl -XGET -u login:password '127.0.0.1:9200/_cat/indices?v'
```

- get the status of one specific index:

```
curl -XGET -u login:password '127.0.0.1:9200/_cat/indices/twitter?v'
```

- display how much memory is used by the indexes:

```
curl -XGET -u login:password '127.0.0.1:9200/_cat/indices?v&h=i,tm&s=tm:desc'
```

- display details of the shards:

```
curl -XGET -u login:password '127.0.0.1:9200/_cat/shards?v'
```

## 18.4 Elasticsearch Document API

### 18.4.1 Create Document

- create a document with a specify ID:

```
curl -XPUT -u login:password '127.0.0.1:9200/twitter/tweet/1?pretty=true' -d'{
 "user" : "lab1",
 "post_date" : "2017-08-25T10:00:00",
 "message" : "testuje Elasticsearch"
}'
```

You should see the output:

```
{
 "_index" : "twitter",
 "_type" : "tweet",
 "_id" : "1",
 "_version" : 1,
 "_shards" : {
 "total" : 2,
 "successful" : 1,
 "failed" : 0
 },
 "created" : true
}
```

- creating a document with an automatically generated ID: (note: PUT-> POST):

```
curl -XPOST -u login:password '127.0.0.1:9200/twitter/tweet?pretty=true' -d'{
 "user" : "lab1",
 "post_date" : "2017-08-25T10:10:00",
 "message" : "testuje automatyczne generowanie ID"
}'
```

You should see the output:

```
{
 "_index" : "twitter",
 "_type" : "tweet",
 "_id" : "AV49sTlM8NzerkV9qJfh",
 "_version" : 1,
 "_shards" : {
 "total" : 2,
 "successful" : 1,
 "failed" : 0
 },
 "created" : true
}
```

## 18.4.2 Delete Document

- delete a document by ID:

```
curl -XDELETE -u login:password '127.0.0.1:9200/twitter/tweet/1?pretty=true'
```

```
curl -XDELETE -u login:password '127.0.0.1:9200/twitter/tweet/AV49sTlM8NzerkV9qJfh?
↳pretty=true'
```

- delete a document using a wildcard:

```
curl -XDELETE -u login:password '127.0.0.1:9200/twitter/tweet/1*?pretty=true'
```

(parametr: action.destructive\_requires\_name must be set to false)

## 18.4.3 Useful commands

- get information about the document:

```
curl -XGET -u login:password '127.0.0.1:9200/twitter/tweet/1?pretty=true'
```

You should see the output:

```
{
 "_index" : "twitter",
 "_type" : "tweet",
 "_id" : "1",
 "_version" : 1,
 "found" : true,
 "_source" : {
 "user" : "lab1",
 "post_date" : "2017-08-25T10:00:00",
 "message" : "testuje Elasticsearch"
 }
}
```

- get the source of the document:

```
curl -XGET -u login:password '127.0.0.1:9200/twitter/tweet/1/_source?pretty=true'
```

You should see the output:

```
{
 "user" : "lab1",
 "post_date" : "2017-08-25T10:00:00",
 "message" : "test of Elasticsearch"
}
```

- get information about all documents in the index:

```
curl -XGET -u login:password '127.0.0.1:9200/twitter*/_search?q=*&pretty=true'
```

You should see the output:

```
{
 "took" : 7,
 "timed_out" : false,
 "_shards" : {
 "total" : 10,
 "successful" : 10,
 "failed" : 0
 },
 "hits" : {
 "total" : 3,
 "max_score" : 1.0,
 "hits" : [{
 "_index" : "twitter",
 "_type" : "tweet",
 "_id" : "AV49sTlM8NzerkV9qJfh",
 "_score" : 1.0,
 "_source" : {
 "user" : "lab1",
 "post_date" : "2017-08-25T10:10:00",
 "message" : "auto generated ID"
 }
 }, {
 "_index" : "twitter",
 "_type" : "tweet",
 "_id" : "1",
 "_score" : 1.0,
 "_source" : {
 "user" : "lab1",
 "post_date" : "2017-08-25T10:00:00",
 "message" : "Elasticsearch test"
 }
 }, {
 "_index" : "twitter2",
 "_type" : "tweet",
 "_id" : "1",
 "_score" : 1.0,
 "_source" : {
 "user" : "elk01",
 "post_date" : "2017-09-05T10:00:00",
 "message" : "manual index created test"
 }
 }
]
}
}
```

- the sum of all documents in a specified index:

```
curl -XGET -u login:password '127.0.0.1:9200/_cat/count/twitter?v'
```

You should see the output:

epoch	timestamp	count
1504281400	17:56:40	2

- the sum of all document in Elasticsearch database:

```
curl -XGET -u login:password '127.0.0.1:9200/_cat/count?v'
```

You should see the output:

```
```bash
epoch                timestamp count
1504281518           17:58:38   493658
```

18.5 Elasticsearch Cluster API

18.5.1 Useful commands

- information about the cluster state:

```
bash"" curl -XGET -u login:password '127.0.0.1:9200/_cluster/health?pretty=true'
```

- information about the role and load of nodes in the cluster:

```
```bash
curl -XGET -u login:password '127.0.0.1:9200/_cat/nodes?v'
```

- information about the available and used place on the cluster nodes:

```
curl -XGET -u login:password '127.0.0.1:9200/_cat/allocation?v'
```

- information which node is currently in the master role:

```
curl -XGET -u login:password '127.0.0.1:9200/_cat/master?v'
```

- information about currently performed operations by the cluster:

```
curl -XGET -u login:password '127.0.0.1:9200/_cat/pending_tasks?v'
```

- information on recoveries / transferred indices:

```
curl -XGET -u login:password '127.0.0.1:9200/_cat/recovery?v'
```

- information about shards in a cluster:

```
curl -XGET -u login:password '127.0.0.1:9200/_cat/shards?v'
```

- detailed information about the cluster:

```
curl -XGET -u login:password '127.0.0.1:9200/_cluster/stats?human&pretty'
```

- detailed information about the nodes:

```
curl -XGET -u login:password '127.0.0.1:9200/_nodes/stats?human&pretty'
```

## 18.6 Elasticsearch Search API

### 18.6.1 Useful commands

- searching for documents by the string:

```
curl -XPOST -u login:password '127.0.0.1:9200/twitter*/tweet/_search?pretty=true' -d '{
 "query": {
 "bool" : {
 "must" : {
 "query_string" : {
 "query" : "test"
 }
 }
 }
 }
}'
```

- searching for document by the string and filtering:

```
curl -XPOST -u login:password '127.0.0.1:9200/twitter*/tweet/_search?pretty=true' -d '{
 "query": {
 "bool" : {
 "must" : {
 "query_string" : {
 "query" : "testuje"
 }
 },
 "filter" : {
 "term" : { "user" : "lab1" }
 }
 }
 }
}'
```

- simple search in a specific field (in this case user) uri query:

```
curl -XGET -u login:password '127.0.0.1:9200/twitter*/_search?q=user:lab1&pretty=true'
```

- simple search in a specific field:

```
curl -XPOST -u login:password '127.0.0.1:9200/twitter*/_search?pretty=true' -d '{
 "query" : {
 "term" : { "user" : "lab1" }
 }
}'
```

## 18.7 Elasticsearch - Mapping, Fielddata and Templates

Mapping is a collection of fields along with a specific data type Fielddata is the field in which the data is stored (requires a specific type - string, float) Template is a template based on which fielddata will be created in a given

index.

### 18.7.1 Useful commands

- Information on all set mappings:

```
curl -XGET -u login:password '127.0.0.1:9200/_mapping?pretty=true'
```

- Information about all mappings set in the index:

```
curl -XGET -u login:password '127.0.0.1:9200/twitter/_mapping/*?pretty=true'
```

- Information about the type of a specific field:

```
curl -XGET -u login:password '127.0.0.1:9200/twitter/_mapping/field/message*?
↪pretty=true'
```

- Information on all set templates:

```
curl -XGET -u login:password '127.0.0.1:9200/_template/*?pretty=true'
```

### 18.7.2 Create - Mapping / Fielddata

- Create - Mapping / Fielddata - It creates index twitter-float and the tweet message field sets to float:

```
curl -XPUT -u login:password '127.0.0.1:9200/twitter-float?pretty=true' -d '{
 "mappings": {
 "tweet": {
 "properties": {
 "message": {
 "type": "float"
 }
 }
 }
 }
}'

curl -XGET -u login:password '127.0.0.1:9200/twitter-float/_mapping/field/message?
↪pretty=true'
```

### 18.7.3 Create Template

- Create Template:

```
curl -XPUT -u login:password '127.0.0.1:9200/_template/template_1' -d'{
 "template" : "twitter4",
 "order" : 0,
 "settings" : {
 "number_of_shards" : 2
 }
}
```

```
curl -XPOST -u login:password '127.0.0.1:9200/twitter4/tweet?pretty=true' -d'{
 "user" : "lab1",
 "post_date" : "2017-08-25T10:10:00",
 "message" : "test of ID generation"
}'
```

```
curl -XGET -u login:password '127.0.0.1:9200/twitter4/_settings?pretty=true'
```

- Create Template2 - Sets the mapping template for all new indexes specifying that the tweet data, in the field called message, should be of the “string” type:

```
curl -XPUT -u login:password '127.0.0.1:9200/_template/template_2' -d'{
 "template" : "*",
 "mappings": {
 "tweet": {
 "properties": {
 "message": {
 "type": "string"
 }
 }
 }
 }
}'
```

## 18.7.4 Delete Mapping

- Delete Mapping - Deleting a specific index mapping (no possibility to delete - you need to index):

```
curl -XDELETE -u login:password '127.0.0.1:9200/twitter2'
```

## 18.7.5 Delete Template

- Delete Template:

```
curl -XDELETE -u login:password '127.0.0.1:9200/_template/template_1?pretty=true'
```

# 18.8 AI Module API

## 18.8.1 Services

The intelligence module has implemented services that allow you to create, modify, delete, execute and read definitions of AI rules.

## 18.8.2 List rules

The list service returns a list of AI rules definitions stored in the system.

Method: GET URL:

```
https://<host>:<port>/api/ai/list?pretty
```

where:

```
host - kibana host address
port - kibana port
?pretty - optional json format parameter
```

Curl:

```
curl -XGET 'https://localhost:5601/api/ai/list?pretty' -u <user>:<password> -k
```

Result: Array of JSON documents:

Field	Value	
	Screen field (description)	
_source.algorithm_type	GMA, GMAL, LRS, LRST, RFRS, SMAL, SMA, TL	
	Algorithm.	
_source.model_name	Not empty string.	
	AI Rule Name.	
_source.search	Search id.	
	Choose search.	
_source.label_field.field		
	Feature to analyse.	
_source.max_probes	Integer value	
	Max probes	
_source.time_frame	1 minute, 5 minutes, 15 minutes, 30	
minutes, 1 hour, 1 day, 1 week, 30 day, 365 day	Time frame	
_source.value_type	min, max, avg, count	
	Value type	
_source.max_predictions	Integer value	
	Max predictions	
_source.threshold	Integer value	
	Threshold	
_source.automatic_cron	Cron format string	
	Automatic cycle	
_source.automatic_enable	true/false	
	Enable	
_source.automatic	true/false	
	Automatic	
_source.start_date	YYYY-MM-DD HH:mm or now	
	Start date	

(continues on next page)

(continued from previous page)

_source.multiply_by_values	Array of string values	└
↪	Multiply by values	└
↪		
_source.multiply_by_field	None or full field name eg.: system.cpu	└
↪	Multiply by field	└
↪		
_source.selectedroles	Array of roles name	└
↪	Role	└
↪		
_source.last_execute_timestamp		└
↪	Last execute	└
↪		

Not screen fields:

_index		Elasticsearch index name.	└
↪			
-----	---	-----	
↪ ---			
_type		Elasticsearch document type.	└
↪			
_id		Elasticsearch document id.	└
↪			
_source.preparation_date		Document preparation date.	└
↪			
_source.machine_state_uid		AI rule machine state uid.	└
↪			
_source.path_to_logs		Path to ai machine logs.	└
↪			
_source.path_to_machine_state		Path to ai machine state files.	└
↪			
_source.searchSourceJSON		Query string.	└
↪			
_source.processing_time		Process operation time.	└
↪			
_source.last_execute_mili		Last executed time in	└
↪ milliseconds.			
_source.pid		Process pid if ai rule is	└
↪ running.			
_source.exit_code		Last executed process exit code.	└
↪			

18.8.3 Show rules

The show service returns a document of AI rule definition by id.

Method: GET URL: https://:api/ai/show/?pretty

where:

host	-	kibana host address
port	-	kibana port
id	-	ai rule document id
?pretty	-	optional json format parameter

Curl:

```
curl -XGET 'https://localhost:5601/api/ai/show/ea9384857delf493fd84dabb6dfb99ce?pretty' -u <user>:<password> -k
```

Result JSON document:

Field	Value
	Screen field (description)
_source.algorithm_type	GMA, GMAL, LRS, LRST, RFRS, SMAL, SMA, TL Algorithm.
_source.model_name	Not empty string. AI Rule Name.
_source.search	Search id. Choose search.
_source.label_field.field	 Feature to analyse.
_source.max_probes	Integer value Max probes
_source.time_frame	1 minute, 5 minutes, 15 minutes, 30 minutes, 1 hour, 1 day, 1 week, 30 day, 365 day Time frame
_source.value_type	min, max, avg, count Value type
_source.max_predictions	Integer value Max predictions
_source.threshold	Integer value Threshold
_source.automatic_cron	Cron format string Automatic cycle
_source.automatic_enable	true/false Enable
_source.automatic	true/false Automatic
_source.start_date	YYYY-MM-DD HH:mm or now Start date
_source.multiply_by_values	Array of string values Multiply by values
_source.multiply_by_field	None or full field name eg.: system.cpu Multiply by field
_source.selectedroles	Array of roles name Role

(continues on next page)

(continued from previous page)

	_source.last_execute_timestamp				Last execute		
↪							
↪							

Not screen fields

	_index				Elasticsearch index name.		
↪							
	-----		---		-----		
↪							
	_type				Elasticsearch document type.		
↪							
	_id				Elasticsearch document id.		
↪							
	_source.preparation_date				Document preparation date.		
↪							
	_source.machine_state_uid				AI rule machine state uid.		
↪							
	_source.path_to_logs				Path to ai machine logs.		
↪							
	_source.path_to_machine_state				Path to ai machine state files.		
↪							
	_source.searchSourceJSON				Query string.		
↪							
	_source.processing_time				Process operation time.		
↪							
	_source.last_execute_mili				Last executed time in		
↪	milliseconds.						
	_source.pid				Process pid if ai rule is		
↪	running.						
	_source.exit_code				Last executed process exit code.		
↪							

18.8.4 Create rules

The create service adds a new document with the AI rule definition.

Method: PUT

URL:

```
https://<host>:<port>/api/ai/create
```

where:

host	-	kibana host address
port	-	kibana port
body	-	JSON with definition of ai rule

Curl:

```
curl -XPUT 'https://localhost:5601/api/ai/create' -u <user>:<password> -k -H "kbn-
↪version: 6.2.4" -H 'Content-type: application/json' -d' {"algorithm_type":"TL",

Result:

JSON document with fields:

```

status - true if ok
id - id of changed document
message - error message

```

Run:

The run service executes a document of AI rule definition by id.

Method: GET

URL:

```
https://<host>:<port>/api/ai/run/<id>
```

where:

```

host - kibana host address
port - kibana port
id - ai rule document id

```

Curl:

```
curl -XGET 'https://localhost:5601/api/ai/run/ea9384857de1f493fd84dabb6dfb99ce' -u <user>:<password> -k
```

Result:

JSON document with fields:

```

status - true if ok
id - id of executed document
message - message

```

## 18.8.6 Delete rules

The delete service removes a document of AI rule definition by id.

Method: DELETE

URL:

```
https://<host>:<port>/api/ai/delete/<id>
```

where:

```

host - kibana host address
port - kibana port
id - ai rule document id

```

Curl:

```
curl -XDELETE 'https://localhost:5601/api/ai/delete/ea9384857delf493fd84dabb6dfb99ce'
-u <user>:<password> -k -H "kbn-version: 6.2.4"
```

Result:

JSON document with fields:

```
status - true if ok
id - id of executed document
message - message
```

## 18.9 Alert module API

### 18.9.1 Create Alert Rule

Method: POST

URL: /api/admin/alertrules

Body:

In the body of call, you must pass the JSON object with the full definition of the rule document:

Name	Description
id	Document ID in Elasticsearch
alertrulename	Rule name (the Name field from the Create Alert tab the name must be the same as the alert name)
alertruleindexpattern	Index pattern (Index pattern field from the Create Alert tab)
selectedroles	Array of roles that have rights to this rule (Roles field from the Create Alert tab)
alertruletype	Alert rule type (Type field from the Create Alert tab)
alertrulemethod	Type of alert method (Alert method field from the Create Alert tab)
alertrulemethoddata	Data for the type of alert (field Email address if alertrulemethod is email Path to script / command if alertrulemethod is command and empty value if alertrulemethod is none)
alertrule_any	Alert script (the Any field from the Create Alert tab)
alertruleimportance	Importance of the rule (Rule importance box from the Create Alert tab)

(continues on next page)

(continued from previous page)

```

| alertruleriskkey | Field for risk calculation (field from the index indicated
↳by alertruleindexpattern according to which the risk will be counted Risk key
↳field from the Create Alert tab) |
| alertruleplaybooks | Playbook table (document IDs) attached to the alert
↳(Playbooks field from the Create Alert tab)
↳
| enable | Value Y or N depending on whether we enable or disable the
↳rule
↳
| authenticator | Constant value index
↳
↳

```

Result OK:

```
"Successfully created rule!!"
```

or if fault, error message.

Example:

```

curl -XPOST 'https://localhost:5601/api/admin/alertrules' -u user:passowrd -k -H "kbn-
↳version: 6.2.4" -H 'Content-type: application/json' -d'
{
 "id": "test_enable_rest",
 "alertrulename": "test enable rest",
 "alertruleindexpattern": "m*",
 "selectedroles": "",
 "alertruletype": "frequency",
 "alertrulemethod": "email",
 "alertrulemethoddata": "ala@local",
 "alertrule_any": "# (Required, frequency specific)\n# Alert when this many
↳documents matching the query occur within a timeframe\nnum_events: 5\n\n# (Required,
↳frequency specific)\n# num_events must occur within this amount of time to trigger
↳an alert\ntimeframe:\n minutes: 2\n\n# (Required)\n# A list of Elasticsearch
↳filters used for find events\n# These filters are joined with AND and nested in a
↳filtered query\n# For more info: http://www.elasticsearch.org/guide/en/
↳elasticsearch/reference/current/query-dsl.html\nfilter:\n- term:\n some_field: \
↳"some_value"\n\n# (Optional, change specific)\n# If true, Alert will poll
↳Elasticsearch using the count api, and not download all of the matching documents.
↳This is useful is you care only about numbers and not the actual data. It should
↳also be used if you expect a large number of query hits, in the order of tens of
↳thousands or more. doc_type must be set to use this.\n#use_count_query:\n\n#
↳(Optional, change specific)\n# Specify the _type of document to search for. This
↳must be present if use_count_query or use_terms_query is set.\n#doc_type:\n\n#
↳(Optional, change specific)\n# If true, Alert will make an aggregation query
↳against Elasticsearch to get counts of documents matching each unique value of
↳query_key. This must be used with query_key and doc_type. This will only return a
↳maximum of terms_size, default 50, unique terms.\n#use_terms_query:\n\n# (Optional,
↳change specific)\n# When used with use_terms_query, this is the maximum number of
↳terms returned per query. Default is 50.\n#terms_size:\n\n# (Optional, change
↳specific)\n# Counts of documents will be stored independently for each value of
↳query_key. Only num_events documents, all with the same value of query_key, will
↳trigger an alert.\n#query_key:\n\n# (Optional, change specific)\n# Will attach all
↳the related events to the event that triggered the frequency alert. For example in
↳an alert triggered with num_events: 3, the 3rd event will trigger the alert on
↳itself and add the other 2 events in a key named related_events that can be
↳accessed in the alerter.\n#attach_related:"

```

(continues on next page)

(continued from previous page)

```
"alertruleplaybooks":[],
"alertruleimportance":50,
"alertruleriskkey":"beat.hostname",
"enable":"Y",
"authenticator":"index"
},
'
```

## 18.9.2 Save Alert Rules

Method: POST

URL:

```
/api/admin/saverules
```

Body:

In the body of call, you must pass the JSON object:

```
'authenticator'
```

Constant value index

Result:

```
"Files created"
```

or if fault, error message.

Example:

```
curl -XPOST 'https://localhost:5601/api/admin/saverules' -u user:password -k -H "kbn-
↪version: 6.2.4" -H 'Content-type: application/json' -d'
 {
 "authenticator":"index"
 }
'
```

## 18.10 Reports module API

### 18.10.1 Create new task

CURL query to create a new csv report:

```
curl -k "https://localhost:5601/api/taskmanagement/export" -XPOST -H 'kbn-xsrf: true'
↪-H 'Content-Type: application/json;charset=utf-8' -u USER:PASSWORD -d '{
 "indexpath": "audit",
 "query": "*",
 "fields": [
 "@timestamp",
 "method",
 "operation",

```

(continues on next page)

(continued from previous page)

```

 "request",
 "username"
],
 "initiatedUser": "logserver ",
 "fromDate": "2019-09-18T00:00:00",
 "toDate": "2019-09-19T00:00:00",
 "timeCriteriaField": "@timestamp",
 "export_type": "csv",
 "export_format": "csv",
 "role": ""
}'

```

Answer:

```
{ "taskId": "1568890625355-cbbe16e1-12ac-b53c-158e-e0919338953c" }
```

bash### Checking the status of the task ###

```
curl -k -XGET -u USER:PASSWORD https://localhost:5601/api/taskmanagement/export/
↪1568890625355-cbbe16e1-12ac-b53c-158e-e0919338953
```

Answer:

- In progress:

```

```bash
{ "taskId": "1568890766279-56667dc8-6bd4-3f42-1773-08722b623ec1", "status":
↪ "Processing" }

```

- Done:

```

{ "taskId": "1568890625355-cbbe16e1-12ac-b53c-158e-e0919338953c", "status":
↪ "Complete", "download": "http://localhost:5601/api/taskmanagement/export/
↪ 1568890625355-cbbe16e1-12ac-b53c-158e-e0919338953c/download" }

```

- Error during execution:

```

```bash
{ "taskId": "1568890794564-120f0549-921f-4459-3114-3ea3f6e861b8", "status": "Error_
↪ Occured" }

```

## 18.10.2 Downloading results

```

curl -k -XGET -u USER:PASSWORD https://localhost:5601/api/taskmanagement/
↪ export/1568890625355-cbbe16e1-12ac-b53c-158e-e0919338953c/download > /tmp/audit_
↪ report.csv

```

## 18.11 License module API

You can check the status of the Energy Logserver license via the API

Method: GET

Curl:

```
curl -u $USER:$PASSWORD -X GET http://localhost:9200/license
```

Result:

```
{ "status": 200, "nodes": "10", "indices": "[*]", "customerName": "example", "issuedOn": "2019-05-27T12:16:16.174326700", "validity": "100", "documents": "", "version": "6.1.6" }
```

## 18.12 User Module API

To modify user accounts, you can use the User Module API.

You can modify the following account parameters:

- username;
- password;
- assigned roles;
- default role;
- authenticator;
- email address.

An example of the modification of a user account is as follows:

```
curl -u $user:$password localhost:9200/_auth/account -XPUT -H 'Content-type: application/json' -d '{
 "username": "logserver",
 "password": "new_password",
 "roles": [
 "admin"
],
 "defaultrole": "admin",
 "authenticator": "index",
 "email": ""
}'
```

The Energy Logserver use Logstash service to dynamically unify data from disparate sources and normalize the data into destination of your choose. A Logstash pipeline has two required elements, *input* and *output*, and one optional element *filter*. The input plugins consume data from a source, the filter plugins modify the data as you specify, and the output plugins write the data to a destination. The default location of the Logstash plugin files is: `/etc/logstash/conf.d/`. This location contain following Energy Logserver

Energy Logserver default plugins:

- `01-input-beats.conf`
- `01-input-syslog.conf`
- `01-input-snmp.conf`
- `01-input-http.conf`
- `01-input-file.conf`
- `01-input-database.conf`
- `020-filter-beats-syslog.conf`
- `020-filter-network.conf`
- `099-filter-geoip.conf`
- `100-output-elasticsearch.conf`
- `naemon_beat.example`
- `perflogs.example`

## 19.1 Logstash - Input “beats”

This plugin wait for receiving data from remote beats services. It use tcp /5044 port for communication:

```
input {
 beats {
 port => 5044
 }
}
```

### 19.1.1 Getting data from share folder

Using beats, you can reading data from FTP, SFTP, SMB share. Connection to remote resources should be done as follows:

#### Input - FTP server

- Installation

```
yum install curlftpfs
```

- Create mount ftp directory

```
mkdir /mnt/my_ftp
```

- Use curlftpfs to mount your remote ftp site. Suppose my access credentials are as follows:

```
urlftpfs ftp-user:ftp-pass@my-ftp-location.local /mnt/my_ftp/
```

#### Input - SFTP server

- Install the required packages

```
yum install sshfs
```

- Add user

```
sudo adduser yourusername fuse
```

- Create local folder

```
mkdir ~/Desktop/sftp
```

- Mount remote folder to local:

```
sshfs HOSTuser@remote.host.or.ip:/host/dir/to/mount ~/Desktop/sftp
```

#### Input - SMB/CIFS server

- Create local folder

```
mkdir ~/Desktop/smb
```

- Mount remote folder to local:

```
mount -t smbfs //remoate.host.or.ip/freigabe /mnt -o username=testuser
```

or `mount -t cifs //remoate.host.or.ip/freigabe /mnt -o username=testuser`

## 19.2 Logstash - Input “network”

This plugin read events over a TCP or UDP socket assigns the appropriate tags:

```
input {
 tcp {
 port => 5514
 type => "network"

 tags => ["LAN", "TCP"]
 }

 udp {
 port => 5514
 type => "network"

 tags => ["LAN", "UDP"]
 }
}
```

## 19.3 Logstash - Input SNMP

The SNMP input polls network devices using Simple Network Management Protocol (SNMP) to gather information related to the current state of the devices operation:

```
input {
 snmp {
 get => ["1.3.6.1.2.1.1.1.0"]
 hosts => [{host => "udp:127.0.0.1/161" community => "public" version =>
↪ "2c" retries => 2 timeout => 1000}]
 }
}
```

## 19.4 Logstash - Input HTTP / HTTPS

Using this input you can receive single or multiline events over http(s). Applications can send an HTTP request to the endpoint started by this input and Logstash will convert it into an event for subsequent processing. Sample definition:

```
input {
 http {
 host => "0.0.0.0"
 port => "8080"
 }
}
```

Events are by default sent in plain text. You can enable encryption by setting `ssl` to true and configuring the `ssl_certificate` and `ssl_key` options:

```
input {
 http {
 host => "0.0.0.0"
 port => "8080"
 ssl => "true"
 ssl_certificate => "path_to_certificate_file"
 ssl_key => "path_to_key_file"
 }
}
```

## 19.5 Logstash - Input File

This plugin stream events from files, normally by tailing them in a manner similar to `tail -0F` but optionally reading them from the beginning. Sample definition:

```
file {
 path => "/tmp/access_log"
 start_position => "beginning"
}
```

## 19.6 Logstash - Input database

This plugin can read data in any database with a JDBC interface into Logstash. You can periodically schedule ingestion using a cron syntax (see schedule setting) or run the query one time to load data into Logstash. Each row in the resultset becomes a single event. Columns in the resultset are converted into fields in the event.

### 19.6.1 Logasth input - MySQL

Download jdbc driver: <https://dev.mysql.com/downloads/connector/j/>

Sample definition:

```
input {
 jdbc {
 jdbc_driver_library => "mysql-connector-java-5.1.36-bin.jar"
 jdbc_driver_class => "com.mysql.jdbc.Driver"
 jdbc_connection_string => "jdbc:mysql://localhost:3306/mydb"
 jdbc_user => "mysql"
 jdbc_password => "mysql"
 parameters => { "favorite_artist" => "Beethoven" }
 schedule => "* * * * *"
 statement => "SELECT * from songs where artist = :favorite_artist"
 }
}
```

### 19.6.2 Logasth input - MSSQL

Download jdbc driver: <https://docs.microsoft.com/en-us/sql/connect/jdbc/download-microsoft-jdbc-driver-for-sql-server?view=sql-server-ver15>

Sample definition:

```
input {
 jdbc {
 jdbc_driver_library => "./mssql-jdbc-6.2.2.jre8.jar"
 jdbc_driver_class => "com.microsoft.sqlserver.jdbc.SQLServerDriver"
 jdbc_connection_string => "jdbc:sqlserver://VB201001000;databaseName=Database;"
 jdbc_user => "mssql"
 jdbc_password => "mssql"
 jdbc_default_timezone => "UTC"
 statement_filepath => "/usr/share/logstash/plugin/query"
 schedule => "*/5 * * * *"
 sql_log_level => "warn"
 record_last_run => "false"
 clean_run => "true"
 }
}
```

### 19.6.3 Logstash input - Oracle

Download jdbc driver: <https://www.oracle.com/database/technologies/appdev/jdbc-downloads.html>

Sample definition:

```
input {
 jdbc {
 jdbc_driver_library => "./ojdbc8.jar"
 jdbc_driver_class => "oracle.jdbc.driver.OracleDriver"
 jdbc_connection_string => "jdbc:oracle:thin:@hostname:PORT/SERVICE"
 jdbc_user => "oracle"
 jdbc_password => "oracle"
 parameters => { "favorite_artist" => "Beethoven" }
 schedule => "* * * * *"
 statement => "SELECT * from songs where artist = :favorite_artist"
 }
}
```

### 19.6.4 Logstash input - PostgreSQL

Download jdbc driver: <https://jdbc.postgresql.org/download.html>

Sample definition:

```
input {
 jdbc {
 jdbc_driver_library => "D:/postgresql-42.2.5.jar"
 jdbc_driver_class => "org.postgresql.Driver"
 jdbc_connection_string => "jdbc:postgresql://127.0.0.1:57610/mydb"
 jdbc_user => "myuser"
 jdbc_password => "mypw"
 statement => "select * from mytable"
 }
}
```

## 19.7 Logstash - Filter “beats syslog”

This filter processing an event data with syslog type:

```

filter {

 if [type] == "syslog" {
 grok {
 match => {
 "message" => [
 # auth: ssh/sudo/su

 "%
→{SYSLOGTIMESTAMP:[system][auth][timestamp]} %{SYSLOGHOST:[system][auth][hostname]}
→sshd(?:\[?[%{POSINT:[system][auth][pid]}\])?: %{DATA:[system][auth][ssh][event]} %

```

## 19.8 Logstash - Filter “network”

This filter processing an event data with network type:

```

filter {
 if [type] == "network" {
 grok {
 named_captures_only => true

```

(continues on next page)

(continued from previous page)

```

match => {
 "message" => [

 # Cisco Firewall
 "%{SYSLOG5424PRI}%{NUMBER:log_sequence#}:%{SPACE}%"
 ↳{IPORHOST:device_ip}: (?..)?%{CISCOTIMESTAMP:log_data} CET: %%{CISCO_
 ↳REASON:facility}-%{INT:severity_level}-%{CISCO_REASON:facility_mnemonic}:%{SPACE}%"
 ↳{GREEDYDATA:event_message}",

 # Cisco Routers
 "%{SYSLOG5424PRI}%{NUMBER:log_sequence#}:%{SPACE}%"

## 19.9 Logstash - Filter “geoip”

This filter processing an events data with IP address and check localization:

```

filter {
 if [src][locality] == "public" {

 geoip {
 source => "[src][ip]"
 target => "[src][geoip]"
 database => "/etc/logstash/geoipdb/GeoLite2-City.mmdb"
 fields => ["city_name", "country_name", "continent_code",
↪ "country_code2", "location"]
 remove_field => ["[src][geoip][ip]"]
 }

 geoip {
 source => "[src][ip]"
 target => "[src][geoip]"
 database => "/etc/logstash/geoipdb/GeoLite2-ASN.mmdb"
 remove_field => ["[src][geoip][ip]"]
 }

 }

 if [dst][locality] == "public" {

 geoip {
 source => "[dst][ip]"
 target => "[dst][geoip]"
 database => "/etc/logstash/geoipdb/GeoLite2-City.mmdb"
 fields => ["city_name", "country_name", "continent_code",
↪ "country_code2", "location"]
 remove_field => ["[dst][geoip][ip]"]
 }

 geoip {
 source => "[dst][ip]"
 target => "[dst][geoip]"
 database => "/etc/logstash/geoipdb/GeoLite2-ASN.mmdb"
 remove_field => ["[dst][geoip][ip]"]
 }

 }

}

```

## 19.10 Logstash - Output to Elasticsearch

This output plugin sends all data to the local Elasticsearch instance and create indexes:

```
output {
 elasticsearch {
 hosts => ["127.0.0.1:9200"]

 index => "%{type}-%{+YYYY.MM.dd}"

 user => "logstash"
 password => "logstash"
 }
}
```

## 19.11 Logstash plugin for “naemon beat”

This Logstash plugin has example of complete configuration for integration with *naemon* application:

```
input {
 beats {
 port => FILEBEAT_PORT
 type => "naemon"
 }
}

filter {
 if [type] == "naemon" {
 grok {
 patterns_dir => ["/etc/logstash/patterns"]
 match => { "message" => "%{NAEMONLOGLINE}" }
 remove_field => ["message"]
 }
 date {
 match => ["naemon_epoch", "UNIX"]
 target => "@timestamp"
 remove_field => ["naemon_epoch"]
 }
 }
}

output {
 # Single index
 # if [type] == "naemon" {
 # elasticsearch {
 # hosts => ["ELASTICSEARCH_HOST:ES_PORT"]
 # index => "naemon-%{+YYYY.MM.dd}"
 # }
 # }

 # Separate indexes
 if [type] == "naemon" {
 if "_grokparsefailure" in [tags] {
 elasticsearch {
 hosts => ["ELASTICSEARCH_HOST:ES_PORT"]
 }
 }
 }
}
```

(continues on next page)

(continued from previous page)

```

 index => "naemongrokfailure"
 }
}
else {
 elasticsearch {
 hosts => ["ELASTICSEARCH_HOST:ES_PORT"]
 index => "naemon-%{+YYYY.MM.dd}"
 }
}
}
}

```

## 19.12 Logstash plugin for “perflog”

This Logstash plugin has example of complete configuration for integration with perflog:

```

input {
 tcp {
 port => 6868
 host => "0.0.0.0"
 type => "perflogs"
 }
}

filter {
 if [type] == "perflogs" {
 grok {
 break_on_match => "true"
 match => {
 "message" => [
 "DATATYPE::%{WORD:datatype}\tTIMET::%{NUMBER:timestamp}\tHOSTNAME::%
→{DATA:hostname}\tSERVICEDESC::%{DATA:servicedescription}\tSERVICEPERFDATA::%
→{DATA:performance}\tSERVICECHECKCOMMAND::.*?HOSTSTATE::%{WORD:hoststate}
→\tHOSTSTATETYPE::.*?SERVICESTATE::%{WORD:servicestate}\tSERVICESTATETYPE::%
→{WORD:servicestatetype} ",
 "DATATYPE::%{WORD:datatype}\tTIMET::%{NUMBER:timestamp}\tHOSTNAME::%
→{DATA:hostname}\tHOSTPERFDATA::%{DATA:performance}\tHOSTCHECKCOMMAND::.*?HOSTSTATE::
→%{WORD:hoststate}\tHOSTSTATETYPE::%{WORD:hoststatetype}"
]
 }
 remove_field => ["message"]
 }
 kv {
 source => "performance"
 field_split => "\t"
 remove_char_key => "\.\'"
 trim_key => " "
 target => "perf_data"
 remove_field => ["performance"]
 allow_duplicate_values => "false"
 transform_key => "lowercase"
 }
 date {
 match => ["timestamp", "UNIX"]

```

(continues on next page)

(continued from previous page)

```

 target => "@timestamp"
 remove_field => ["timestamp"]
 }
}

output {
 if [type] == "perflogs" {
 elasticsearch {
 hosts => ["127.0.0.1:9200"]
 index => "perflogs-%{+YYYY.MM.dd}"
 }
 }
}

```

## 19.13 Single password in all Logstash outputs

You can set passwords and other Logstash pipeline settings as environment variables. This can be useful if the password was changed for the `logstash` user and it must be to update in the configuration files.

Configuration steps:

1. Create the service file:

```
mkdir -p /etc/systemd/system/logstash.service.d vi /etc/systemd/system/logstash.service.d/logstash.conf
```

```

[Service]
Environment="ELASTICSEARCH_ES_USER=logserver"
Environment="ELASTICSEARCH_ES_PASSWD=logserver"

```

2. Reload systemctl daemon:

```
systemctl daemon-reload
```

3. Sample definition of Logstash output pipeline section:

```

output {
 elasticsearch {
 index => "test-%{+YYYY.MM.dd}"
 user => "${ELASTICSEARCH_ES_USER:elastic}"
 password => "${ELASTICSEARCH_ES_PASSWD:changeme}"
 }
}

```

## 19.14 Secrets keystore for secure settings

When you configure Logstash, you can use the Logstash keystore to securely store secret values for use in configuration settings (passwords, usernames, other settings).

Configuration steps:

1. Set the keystore password

```
vi /etc/sysconfi/logstash
LOGSTASH_KEYSTORE_PASS=keystorepass
```

2. Create the new keystore:

```
/usr/share/logstash/bin/logstash-keystore create --path.settings /etc/logstash
```

During creation keystore you can provide the keystore password

3. Add new entry to keystore:

```
usr/share/logstash/bin/logstash-keystore add ES_PWD --path.settings /etc/logstash
```

When adding an entry to the keystore, set the value of the entry.

4. Listing added entries:

```
/usr/share/logstash/bin/logstash-keystore list --path.settings /etc/logstash
```

5. Removing entries:

```
/usr/share/logstash/bin/logstash-keystore remove ES_PWD --path.settings /etc/
↪logstash
```

Sample definition of Logstash output pipeline section:

```
output {
 elasticsearch {
 index => "test-%{+YYYY.MM.dd}"
 user => "${ES_PWD}"
 password => "${ES_PWD}"
 }
}
```

## 19.15 Enabling encryption for Apache Kafka clients

Kafka allows you to distribute the load between nodes receiving data and encrypts communication.

Architecture example:

### 19.15.1 The Kafka installation

Documentation during creation.

### 19.15.2 Enabling encryption in Kafka

Generate SSL key and certificate for each Kafka broker

```
keytool -keystore server.keystore.jks -alias localhost -validity {validity} -genkey -
↪keyalg RSA
```

Configuring Host Name In Certificates

```
keytool -keystore server.keystore.jks -alias localhost -validity {validity} -genkey -
↪keyalg RSA -ext SAN=DNS:{FQDN}
```

Verify content of the generated certificate:

```
keytool -list -v -keystore server.keystore.jks
```

### Creating your own CA

```
openssl req -new -x509 -keyout ca-key -out ca-cert -days 365
keytool -keystore client.truststore.jks -alias CARoot -import -file ca-cert
keytool -keystore server.truststore.jks -alias CARoot -import -file ca-cert
```

### Signing the certificate

```
keytool -keystore server.keystore.jks -alias localhost -certreq -file cert-file
openssl x509 -req -CA ca-cert -CAkey ca-key -in cert-file -out cert-signed -days
↳{validity} -CAcreateserial -passin pass:{ca-password}
```

Import both the certificate of the CA and the signed certificate into the keystore

```
keytool -keystore server.keystore.jks -alias CARoot -import -file ca-cert
keytool -keystore server.keystore.jks -alias localhost -import -file cert-signed
```

## 19.15.3 Configuring Kafka Brokers

In `/etc/kafka/server.properties` file set the following options:

```
listeners=PLAINTEXT://host.name:port,SSL://host.name:port

ssl.keystore.location=/var/private/ssl/server.keystore.jks
ssl.keystore.password=test1234
ssl.key.password=test1234
ssl.truststore.location=/var/private/ssl/server.truststore.jks
ssl.truststore.password=test1234
```

and restart the Kafka service

```
systemctl restart kafka
```

## 19.15.4 Configuring Kafka Clients

### Logstash

Configure the output section in Logstash based on the following example:

```
output {
 kafka {
 bootstrap_servers => "host.name:port"
 security_protocol => "SSL"
 ssl_truststore_type => "JKS"
 ssl_truststore_location => "/var/private/ssl/client.truststore.jks"
 ssl_truststore_password => "test1234"
 client_id => "host.name"
 topic_id => "Topic-1"
 codec => json
 }
}
```

Configure the input section in Logstash based on the following example:

```
input {
 kafka {
 bootstrap_servers => "host.name:port"
 security_protocol => "SSL"
 ssl_truststore_type => "JKS"
 ssl_truststore_location => "/var/private/ssl/client.truststore.jks"
 ssl_truststore_password => "test1234"
 consumer_threads => 4
 topics => ["Topic-1"]
 codec => json
 tags => ["kafka"]
 }
}
```

## 20.1 OP5 - Naemon logs

### 20.1.1 Logstash

1. In Energy Logserver `naemon_beat.conf` set up `ELASTICSEARCH_HOST`, `ES_PORT`, `FILEBEAT_PORT`
2. Copy Energy Logserver `naemon_beat.conf` to `/etc/logstash/conf.d`
3. Based on “`FILEBEAT_PORT`” if firewall is running:

```
sudo firewall-cmd --zone=public --permanent --add-port=FILEBEAT_PORT/tcp
sudo firewall-cmd --reload
```

1. Based on amount of data that elasticsearch will receive you can also choose whether you want index creation to be based on months or days:

```
index => "Energy Logserver-naemon-%{+YYYY.MM} "
or
index => "Energy Logserver-naemon-%{+YYYY.MM.dd} "
```

1. Copy naemon file to `/etc/logstash/patterns` and make sure it is readable by logstash process
2. Restart *logstash* configuration e.g.:

```
sudo systemctl restart logstash
```

### 20.1.2 Elasticsearch

1. Connect to Elasticsearch node via SSH and Install index pattern for naemon logs. Note that if you have a default pattern covering *settings* section you should delete/modify that in `naemon_template.sh`:

```
"settings": {
 "number_of_shards": 5,
 "auto_expand_replicas": "0-1"
},
```

1. Install template by running: `./naemon_template.sh`

### 20.1.3 Energy Logserver Monitor

1. On Energy Logserver Monitor host install filebeat (for instance via rpm <https://www.elastic.co/downloads/beats/filebeat>)
2. In `/etc/filebeat/filebeat.yml` add:

```
Filebeat inputs
filebeat.config.inputs:
 enabled: true
 path: configs/*.yml
```

3. You also will have to configure the output section in `filebeat.yml`. You should have one logstash output:

```
#----- Logstash output -----
output.logstash:
 # The Logstash hosts
 hosts: ["LOGSTASH_IP:FILEBEAT_PORT"]
```

If you have few logstash instances - Logstash section has to be repeated on every node and `hosts:` should point to all of them:

```
hosts: ["LOGSTASH_IP:FILEBEAT_PORT", "LOGSTASH_IP:FILEBEAT_PORT", "LOGSTASH_
↪IP:FILEBEAT_PORT"]
```

4. Create `/etc/filebeat/configs` catalog.
5. Copy `naemon_logs.yml` to a newly created catalog.
6. Check the newly added configuration and connection to logstash. Location of executable might vary based on os:

```
/usr/share/filebeat/bin/filebeat --path.config /etc/filebeat/ test config
/usr/share/filebeat/bin/filebeat --path.config /etc/filebeat/ test output
```

7. Restart filebeat:

```
sudo systemctl restart filebeat # RHEL/CentOS 7
sudo service filebeat restart # RHEL/CentOS 6
```

### 20.1.4 Elasticsearch

At this moment there should be a new index on the Elasticsearch node:

```
curl -XGET '127.0.0.1:9200/_cat/indices?v'
```

Example output:

	health	status	index	uuid	pri	rep	docs.count	
↪ docs.deleted			store.size	pri.store.size				
↪ 0	green	open	Energy Logserver-naemon-2018.11	gO8XRshITNm63nI_RVCy8w	1			
	23176		0	8.3mb				

If the index has been created, in order to browse and visualise the data, “index pattern” needs to be added in Kibana.

## 20.2 OP5 - Performance data

Below instruction requires that between Energy Logserver node and Elasticsearch node is working Logstash instance.

### 20.2.1 Elasticsearch

1. First, settings section in *Energy Logservertemplate.sh* should be adjusted, either:

- there is a default template present on Elasticsearch that already covers shards and replicas then settings sections should be removed from the *Energy Logservertemplate.sh* before executing
- there is no default template - shards and replicas should be adjusted for you environment (keep in mind replicas can be added later, while changing shards count on existing index requires reindexing it)

```
"settings": {
 "number_of_shards": 5,
 "number_of_replicas": 0
}
```

2. In URL *Energy Logserverperfdata* is a name for the template - later it can be search for or modify with it.
3. The “*template*” is an index pattern. New indices matching it will have the settings and mapping applied automatically (change it if you index name for *Energy Logserver perfdata* is different).
4. Mapping name should match documents type:

```
"mappings": {
 "Energy Logserverperflogs"
```

Running *Energy Logservertemplate.sh* will create a template (not index) for Energy Logserver perf data documents.

### 20.2.2 Logstash

1. The *Energy Logserverperflogs.conf* contains example of *input/filter/output* configuration. It has to be copied to */etc/logstash/conf.d/*. Make sure that the *logstash* has permissions to read the configuration files:

`chmod 664 /etc/logstash/conf.d/Energy Logserverperflogs.conf`

1. In the input section comment/uncomment “*beats*” or “*tcp*” depending on preference (beats if *Filebeat* will be used and tcp if *NetCat*). The port and the type has to be adjusted as well:

```
port => PORT_NUMBER
type => "Energy Logserverperflogs"
```

2. In a filter section type has to be changed if needed to match the input section and Elasticsearch mapping.

3. In an output section type should match with the rest of a *config*. host should point to your elasticsearch node. index name should correspond with what has been set in elasticsearch template to allow mapping application. The date for index rotation in its name is recommended and depending on the amount of data expecting to be transferred should be set to daily (+YYYY.MM.dd) or monthly (+YYYY.MM) rotation:

```
hosts => ["127.0.0.1:9200"]
index => "Energy Logserver-perflogs-%{+YYYY.MM.dd}"
```

4. Port has to be opened on a firewall:

```
sudo firewall-cmd --zone=public --permanent --add-port=PORT_NUMBER/tcp
sudo firewall-cmd --reload
```

5. Logstash has to be reloaded:

```
sudo systemctl restart logstash
```

or

```
sudo kill -1 LOGSTASH_PID
```

## 20.2.3 Energy Logserver Monitor

1. You have to decide whether FileBeat or NetCat will be used. In case of Filebeat - skip to the second step. Otherwise:

- Comment line:

```
54 open(my $logFileHandler, '>>', $hostPerfLogs) or die "Could not open
 ↳$hostPerfLogs"; #FileBeat
• Uncomment lines:
55 # open(my $logFileHandler, '>', $hostPerfLogs) or die "Could not open
 ↳$hostPerfLogs"; #NetCat
...
88 # my $logstashIP = "LOGSTASH_IP";
89 # my $logstashPORT = "LOGSTASH_PORT";
90 # if (-e $hostPerfLogs) {
91 # my $pid1 = fork();
92 # if ($pid1 == 0) {
93 # exec("/bin/cat $hostPerfLogs | /usr/bin/nc -w 30 $logstashIP
 ↳$logstashPORT");
94 # }
95 # }
```

- In process-service-perfdata-log.pl and process-host-perfdata-log.pl: change logstash IP and port:

```
92 my $logstashIP = "LOGSTASH_IP";
93 my $logstashPORT = "LOGSTASH_PORT";
```

1. In case of running single Energy Logserver node, there is no problem with the setup. In case of a peered environment *\$do\_on\_host* variable has to be set up and the script *process-service-perfdata-log.pl/process-host-perfdata-log.pl* has to be propagated on all of Energy Logserver nodes:

```
16 $do_on_host = "EXAMPLE_HOSTNAME"; # Energy Logserver node name to run the script on
17 $hostName = hostname; # will read hostname of a node running the script
```

1. Example of command definition (*/opt/monitor/etc/checkcommands.cfg*) if scripts have been copied to */opt/plugins/custom/*:

```
command 'process-service-perfdata-log'
define command{
 command_name process-service-perfdata-log
 command_line /opt/plugins/custom/process-service-perfdata-log.
 ↪pl $TIMET$
}
command 'process-host-perfdata-log'
define command{
 command_name process-host-perfdata-log
 command_line /opt/plugins/custom/process-host-perfdata-log.pl
 ↪$TIMET$
}
```

1. In */opt/monitor/etc/naemon.cfg* *service\_perfdata\_file\_processing\_command* and *host\_perfdata\_file\_processing\_command* has to be changed to run those custom scripts:

```
service_perfdata_file_processing_command=process-service-perfdata-log
host_perfdata_file_processing_command=process-host-perfdata-log
```

In addition *service\_perfdata\_file\_template* and *host\_perfdata\_file\_template* can be changed to support sending more data to Elasticsearch. For instance, by adding *\$HOSTGROUPNAMES\$* and *\$SERVICEGROUPNAMES\$* macros logs can be separated better (it requires changes to Logstash filter config as well)

1. Restart naemon service:

```
sudo systemctl restart naemon # CentOS/RHEL 7.x
sudo service naemon restart # CentOS/RHEL 7.x
```

1. If *FileBeat* has been chosen, append below to *filebeat.conf* (adjust IP and PORT):

```
filebeat.inputs:
type: log
enabled: true
paths:
- /opt/monitor/var/service_performance.log
- /opt/monitor/var/host_performance.log
tags: ["Energy Logserverperflogs"]
output.logstash:
The Logstash hosts
hosts: ["LOGSTASH_IP:LOGSTASH_PORT"]
```

1. Restart FileBeat service:

```
sudo systemctl restart filebeat # CentOS/RHEL 7.x
sudo service filebeat restart # CentOS/RHEL 7.x
```

## 20.2.4 Kibana

At this moment there should be new index on the Elasticsearch node with performance data documents from Energy Logserver Monitor. Login to an Elasticsearch node and run: `curl -XGET '127.0.0.1:9200/_cat/indices?v'` Example output:

health	status	index		pri	rep	docs.count	docs.deleted	store.size	
↪	pri	store.size							
green	open	auth		5	0	7	6230	1.8mb	↪
↪		1.8mb							
green	open	Energy Logserver-perflogs-2018.09.14		5	0	72109		0	↪
↪	24.7mb	24.7mb							

After a while, if there is no new index make sure that:

- Naemon is running on Energy Logserver node
- Logstash service is running and there are no errors in: `/var/log/logstash/logstash-plain.log`
- Elasticsearch service is running and there are no errors in: `/var/log/elasticsearch/elasticsearch.log`

If the index has been created, in order to browse and visualize the data “*index pattern*” needs to be added to Kibana.

1. After logging in to Kibana GUI go to *Settings* tab and add *Energy Logserver-perflogs-\** pattern. Chose *@timestamp* time field and click *Create*.
2. Performance data logs should be now accessible from Kibana GUI Discovery tab ready to be visualize.

## 20.3 OP5 Beat

The op5beat is small agent for collecting metrics from op5 Monitor.

The op5beat is located in the installation directory: `utils/op5integration/op5beat`

### 20.3.1 Installation for Centos7 and newer

1. Copy the necessary files to the appropriate directories:

```
cp -rf etc/* /etc/
cp -rf usr/* /usr/
cp -rf var/* /var/
```

1. Configure and start op5beat service (systemd):

```
cp -rf op5beat.service /usr/lib/systemd/system/
systemctl daemon-reload
systemctl enable op5beat
systemctl start op5beat
```

### 20.3.2 Installation for Centos6 and older

1. Copy the necessary files to the appropriate directories:

```
cp -rf etc/* /etc/
cp -rf usr/* /usr/
cp -rf var/* /var/
```

1. Configure and start op5beat service:

- sysV init:

```
cp -rf op5beat.service /etc/rc.d/init.d/op5beat
chkconfig op5beat on
service op5beat start
```

- supervisor (optional):

```
yum install supervisor
cp -rf supervisord.conf /etc/supervisord.conf
```

## 20.4 The Grafana instalation

1. To install the Grafana application you should:

- add necessary repository to operating system:

```
[root@localhost ~]# cat /etc/yum.repos.d/grafan.repo
[grafana]
name=grafana
baseurl=https://packagecloud.io/grafana/stable/el/7/$basearch
repo_gpgcheck=1
enabled=1
gpgcheck=1
gpgkey=https://packagecloud.io/gpg.key https://grafanarel.s3.amazonaws.com/
RPM-GPG-KEY-grafana
sslverify=1
sslcacert=/etc/pki/tls/certs/ca-bundle.crt
[root@localhost ~]#
```

- install the Grafana with following commands:

```
[root@localhost ~]# yum search grafana
Loaded plugins: fastestmirror
Loading mirror speeds from cached hostfile
 * base: ftp.man.szczecin.pl
 * extras: centos.slaskdatacenter.com
 * updates: centos.slaskdatacenter.com

N/S matched: grafana_

grafana.x86_64 : Grafana
pcp-webapp-grafana.noarch : Grafana web application for Performance Co-
Pilot (PCP)

Name and summary matches only, use "search all" for everything.

[root@localhost ~]# yum install grafana
```

- to run application use following commands:

```
[root@localhost ~]# systemctl enable grafana-server
Created symlink from /etc/systemd/system/multi-user.target.wants/grafana-
server.service to /usr/lib/systemd/system/grafana-server.service.
[root@localhost ~]#
[root@localhost ~]# systemctl start grafana-server
```

(continues on next page)

(continued from previous page)

```
[root@localhost ~]# systemctl status grafana-server
grafana-server.service - Grafana instance
 Loaded: loaded (/usr/lib/systemd/system/grafana-server.service; enabled; ↳
 vendor preset: disabled)
 Active: active (running) since Thu 2018-10-18 10:41:48 CEST; 5s ago
 Docs: http://docs.grafana.org
 Main PID: 1757 (grafana-server)
 CGroup: /system.slice/grafana-server.service
 └─1757 /usr/sbin/grafana-server --config=/etc/grafana/grafana.
 ↳ini --pidfile=/var/run/grafana/grafana-server.pid cfg:default.paths.logs=/
 ↳var/log/grafana cfg:default.paths.data=/var/lib/grafana cfg:default.paths.
 ↳plugins=/var...

[root@localhost ~]#
```

## 2. To connect the Grafana application you should:

- define the default login/password (line 151;154 in config file)

```
[root@localhost ~]# cat /etc/grafana/grafana.ini
148 ##### Security #####
↳###
149 [security]
150 # default admin user, created on startup
151 admin_user = admin
152
153 # default admin password, can be changed before first start of grafana, or ↳
↳in profile settings
154 admin_password = admin
155
```

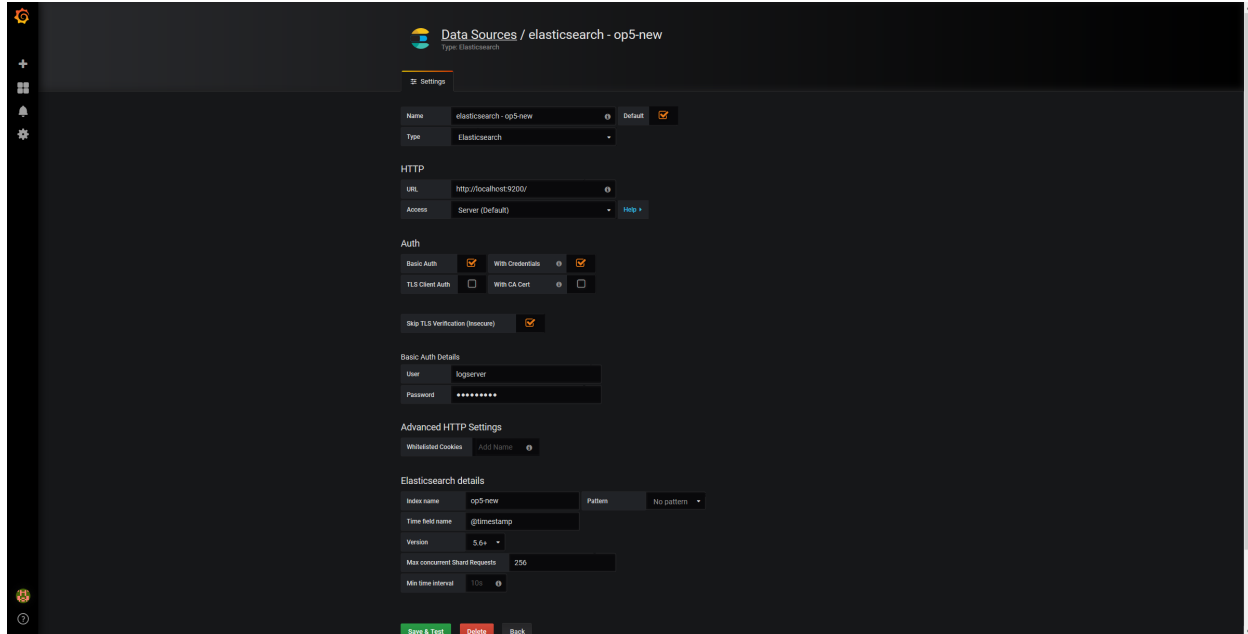

- restart *grafana-server* service:

```
[root@localhost ~]# systemctl restart grafana-server
```

- Login to Grafana user interface using web browser: *http://ip:3000*

- use login and password that you set in the config file.
- Use below example to set connection to Elasticsearch server:

## 20.5 The Beats configuration

### 20.5.1 Kibana API

Reference link: <https://www.elastic.co/guide/en/kibana/master/api.html>

After installing any of beats package you can use ready to use dashboard related to this beat package. For instance dashboard and index pattern are available in `/usr/share/filebeat/kibana/6/` directory on Linux.

Before uploading index-pattern or dashboard you have to authorize yourself:

1. Set up `login/password/kibana_ip` variables, e.g.:

```
login=my_user
password=my_password
kibana_ip=10.4.11.243
```

2. Execute command which will save authorization cookie:

```
curl -c authorization.txt -XPOST -k "https://${kibana_ip}:5601/login" -d
↪ "username=${username}&password=${password}&version=6.2.3&location=https%3A%2F%2F
↪ ${kibana_ip}%3A5601%2Flogin"
```

3. Upload index-pattern and dashboard to *Kibana*, e.g.:

```
curl -b authorization.txt -XPOST -k "https://${kibana_ip}:5601/api/kibana/
↪ dashboards/import" -H 'kbn-xsrf: true' -H 'Content-Type: application/json' -d@/
↪ usr/share/filebeat/kibana/6/index-pattern/filebeat.json
curl -b authorization.txt -XPOST -k "https://${kibana_ip}:5601/api/kibana/
↪ dashboards/import" -H 'kbn-xsrf: true' -H 'Content-Type: application/json' -d@/
↪ usr/share/filebeat/kibana/6/dashboard/Filebeat-mysql.json
```

4. When you want to upload beats index template to Elasticsearch you have to recover it first (usually you do not send logs directly to Es rather than to Logstash first):

```
/usr/bin/filebeat export template --es.version 6.2.3 >> /path/to/beats_template.
↪ json
```

5. After that you can upload it as any other template (Access Es node with SSH):

```
curl -XPUT "localhost:9200/_template/Energy_Logserverperfdata" -H'Content-Type:
↪ application/json' -d@beats_template.json
```

## 20.6 Wazuh integration

Energy Logserver can integrate with the Wazuh, which is lightweight agent is designed to perform a number of tasks with the objective of detecting threats and, when necessary, trigger automatic responses. The agent core capabilities are:

- Log and events data collection
- File and registry keys integrity monitoring
- Inventory of running processes and installed applications
- Monitoring of open ports and network configuration

- Detection of rootkits or malware artifacts
- Configuration assessment and policy monitoring
- Execution of active responses

The Wazuh agents run on many different platforms, including Windows, Linux, Mac OS X, AIX, Solaris and HP-UX. They can be configured and managed from the Wazuh server.

## 20.6.1 Deploying Wazuh Server

<https://documentation.wazuh.com/current/installation-guide/installing-wazuh-server/index.html#>

## 20.6.2 Deploying Wazuh Agent

<https://documentation.wazuh.com/current/installation-guide/installing-wazuh-agent/index.html>

## 20.6.3 Filebeat configuration

## 20.7 BRO integration

## 20.8 2FA authorization with Google Auth Provider (example)

### 20.8.1 Software used (tested versions):

- NGiNX (1.16.1 - from CentOS base repository)
- oauth2\_proxy ([https://github.com/pusher/oauth2\\_proxy/releases](https://github.com/pusher/oauth2_proxy/releases) - 4.0.0)

### 20.8.2 The NGiNX configuration:

1. Copy the `ng_oauth2_proxy.conf` to `/etc/nginx/conf.d/`;

```
server {
 listen 443 default ssl;
 server_name logserver.local;
 ssl_certificate /etc/kibana/ssl/logserver.org.crt;
 ssl_certificate_key /etc/kibana/ssl/logserver.org.key;
 ssl_session_cache builtin:1000 shared:SSL:10m;
 add_header Strict-Transport-Security max-age=2592000;

 location /oauth2/ {
 proxy_pass http://127.0.0.1:4180;
 proxy_set_header Host $host;
 proxy_set_header X-Real-IP $remote_addr;
 proxy_set_header X-Scheme $scheme;
 proxy_set_header X-Auth-Request-Redirect $request_uri;
 # or, if you are handling multiple domains:
 # proxy_set_header X-Auth-Request-Redirect $scheme://$host$request_uri;
 }
 location = /oauth2/auth {
```

(continues on next page)

(continued from previous page)

```

proxy_pass http://127.0.0.1:4180;
proxy_set_header Host $host;
proxy_set_header X-Real-IP $remote_addr;
proxy_set_header X-Scheme $scheme;
nginx auth_request includes headers but not body
proxy_set_header Content-Length "";
proxy_pass_request_body off;
}

location / {
 auth_request /oauth2/auth;
 error_page 401 = /oauth2/sign_in;

 # pass information via X-User and X-Email headers to backend,
 # requires running with --set-xauthrequest flag
 auth_request_set $user $upstream_http_x_auth_request_user;
 auth_request_set $email $upstream_http_x_auth_request_email;
 proxy_set_header X-User $user;
 proxy_set_header X-Email $email;

 # if you enabled --pass-access-token, this will pass the token to the backend
 auth_request_set $token $upstream_http_x_auth_request_access_token;
 proxy_set_header X-Access-Token $token;

 # if you enabled --cookie-refresh, this is needed for it to work with auth_
 request
 auth_request_set $auth_cookie $upstream_http_set_cookie;
 add_header Set-Cookie $auth_cookie;

 # When using the --set-authorization-header flag, some provider's cookies can_
 exceed the 4kb
 # limit and so the OAuth2 Proxy splits these into multiple parts.
 # Nginx normally only copies the first `Set-Cookie` header from the auth_
 request to the response,
 # so if your cookies are larger than 4kb, you will need to extract additional_
 cookies manually.
 auth_request_set $auth_cookie_name_upstream_1 $upstream_cookie_auth_cookie_
 name_1;

 # Extract the Cookie attributes from the first Set-Cookie header and append_
 them
 # to the second part ($upstream_cookie_* variables only contain the raw_
 cookie content)
 if ($auth_cookie ~* "(; .*)") {
 set $auth_cookie_name_0 $auth_cookie;
 set $auth_cookie_name_1 "auth_cookie__oauth2_proxy_1=$auth_cookie_name_
 upstream_1$1";
 }

 # Send both Set-Cookie headers now if there was a second part
 if ($auth_cookie_name_upstream_1) {
 add_header Set-Cookie $auth_cookie_name_0;
 add_header Set-Cookie $auth_cookie_name_1;
 }

 proxy_pass https://127.0.0.1:5601;
 # or "root /path/to/site;" or "fastcgi_pass ..." etc

```

(continues on next page)

(continued from previous page)

```
}
}
```

2. Set `ssl_certificate` and `ssl_certificate_key` path in `ng_oauth2_proxy.conf`

When SSL is set using nginx proxy, Kibana can be started with http. However, if it is to be run with encryption, you also need to change `proxy_pass` to the appropriate one.

### 20.8.3 The `oauth2_proxy` configuration:

1. Create a directory in which the program will be located and its configuration:

```
mkdir -p /usr/share/oauth2_proxy/
mkdir -p /etc/oauth2_proxy/
```

2. Copy files to directories:

```
cp oauth2_proxy /usr/share/oauth2_proxy/
cp oauth2_proxy.cfg /etc/oauth2_proxy/
```

3. Set directives according to OAuth configuration in Google Cloud project

```
cfg
client_id =
client_secret =
the following limits domains for authorization (* - all)
email_domains = [
 "*"
]
```

4. Set the following according to the public hostname:

```
cookie_domain = "kibana-host.org"
```

5. In case of in restrictions for a specific group defined on the Google side:

- Create administrative account: <https://developers.google.com/identity/protocols/OAuth2ServiceAccount> ;
- Get configuration to JSON file and copy Client ID;
- On the dashboard of the Google Cloud select “APIs & Auth” -> “APIs”;
- Click on “Admin SDK” and “Enable API”;
- Follow the instruction at [https://developers.google.com/admin-sdk/directory/v1/guides/delegation#delegate\\_domain-wide\\_authority\\_to\\_your\\_service\\_account](https://developers.google.com/admin-sdk/directory/v1/guides/delegation#delegate_domain-wide_authority_to_your_service_account) and give the service account the following permissions:

```
https://www.googleapis.com/auth/admin.directory.group.readonly
https://www.googleapis.com/auth/admin.directory.user.readonly
```

- Follow the instructions to grant access to the Admin API <https://support.google.com/a/answer/60757>
- Create or select an existing administrative email in the Gmail domain to flag it `google-admin-email`
- Create or select an existing group to flag it `google-group`
- Copy the previously downloaded JSON file to `/etc/oauth2_proxy/`.
- In file `oauth2_proxy` set the appropriate path:

```
google_service_account_json =
```

## 20.8.4 Service start up

- Start the NGiNX service
- Start the oauth2\_proxy service

```
/usr/share/oauth2_proxy/oauth2_proxy -config="/etc/oauth2_proxy/oauth2_proxy.cfg"
```

In the browser enter the address pointing to the server with the Energy Logserver installation

## 20.9 Cerebro - Elasticsearch web admin tool

### 20.9.1 Software Requirements

1. Cerebro v0.8.4

```
wget 'https://github.com/lmenezes/cerebro/releases/download/v0.8.4/cerebro-0.8.4.tgz'
```

1. Java 11+ [for basic-auth setup]

```
yum install java-11-openjdk-headless.x86_64
```

1. Java 1.8.0 [without authorization]

```
yum install java-1.8.0-openjdk-headless
```

### 20.9.2 Firewall Configuration

```
firewall-cmd --permanent --add-port=5602/tcp
firewall-cmd --reload
```

### 20.9.3 Cerebro Configuration

1. Extract archive & move directory

```
tar -xvf cerebro-0.8.4.tgz -C /opt/
mv /opt/cerebro-0.8.4/ /opt/cerebro
```

1. Add Cerebro service user

```
useradd -M -d /opt/cerebro -s /sbin/nologin cerebro
```

1. Change Cerbero permissions

```
chown -R cerebro:cerebro /opt/cerebro && chmod -R 700 /opt/cerebro
```

1. Install Cerbero service (`cerebro.service`):

```
[Unit]
Description=Cerebro

[Service]
Type=simple
User=cerebro
Group=cerebro
ExecStart=/opt/cerebro/bin/cerebro "-Dconfig.file=/opt/cerebro/conf/application.conf"
Restart=always
WorkingDirectory=/opt/cerebro

[Install]
WantedBy=multi-user.target
```

```
cp cerebro.service /usr/lib/systemd/system/
systemctl daemon-reload
systemctl enable cerebro
```

### 1. Customize configuration file: /opt/cerebro/conf/application.conf

```
- Authentication
auth = {
 type: basic
 settings: {
 username = "user"
 password = "password"
 }
}
```

```
- A list of known Elasticsearch hosts
```

```
hosts = [
 {
 host = "http://localhost:9200"
 name = "user"
 auth = {
 username = "username"
 password = "password"
 }
 }
]
```

If needed uses secure connection (SSL) with Elasticsearch, set the following section that contains path to certificate. And change the host definition from http to https:

```
play.ws.ssl {
 trustManager = {
 stores = [
 { type = "PEM", path = "/etc/elasticsearch/ssl/rootCA.crt" }
]
 }
}
play.ws.ssl.loose.acceptAnyCertificate=true
```

- SSL access to cerebro

```
http = {
 port = "disabled"
}
https = {
 port = "5602"
}
#SSL access to cerebro - no self signed certificates
#play.server.https {
keyStore = {
path = "keystore.jks",
password = "SuperSecretKeystorePassword"
}
#}

#play.ws.ssl {
trustManager = {
stores = [
{ type = "JKS", path = "truststore.jks", password =
↪ "SuperSecretTruststorePassword" }
]
}
#}
#}
```

#### 1. Start the service

```
systemctl start cerebro
goto: https://127.0.0.1:5602
```

## 20.9.4 Optional configuration

#### 1. Register backup/snapshot repository for Elasticsearch

```
curl -k -XPUT "https://127.0.0.1:9200/_snapshot/backup?pretty" -H
↪ 'Content-Type: application/json' -d'
{
 "type": "fs",
 "settings": {
 "location": "/var/lib/elasticsearch/backup/"
 }
}' -u user:password
```

#### 1. Login using curl/kibana

```
curl -k -XPOST 'https://127.0.0.1:5602/auth/login' -H 'mimeType: application/x-www-
↪ form-urlencoded' -d 'user=user&password=passwd' -c cookie.txt
curl -k -XGET 'https://127.0.0.1:5602' -b cookie.txt
```

## 20.10 Curator - Elasticsearch index management tool

Curator is a tool that allows you to perform index management tasks, such as:

- Close Indices
- Delete Indices

- Delete Snapshots
- Forcemerge segments
- Changing Index Settings
- Open Indices
- Reindex data

And other.

### 20.10.1 Curator installation

Curator is delivered with the client node installer.

### 20.10.2 Curator configuration

Create directory for configuration:

```
mkdir /etc/curator
```

Create directory for Curator logs file:

```
mkdir /var/log/curator
```

### 20.10.3 Running Curator

The curator executable is located in the directory:

```
/usr/share/kibana/curator/bin/curator
```

Curator requires two parameters:

- config - path to configuration file for Curator
- path to action file for Curator

Example running command:

```
/usr/share/kibana/curator/bin/curator --config /etc/curator/curator.conf /etc/curator/
↪close_indices.yml
```

### 20.10.4 Sample configuration file

---

Remember, leave a key empty if there is no value. None will be a string, not a Python “NoneType”

```
client:
 hosts:
 - 127.0.0.1
 port: 9200
url_prefix:
use_ssl: False
```

(continues on next page)

(continued from previous page)

```
certificate:
client_cert:
client_key:
ssl_no_validate: False
http_auth: $user:$password
timeout: 30
master_only: True

logging:
 loglevel: INFO
 logfile: /var/log/curator/curator.log
 logformat: default
 blacklist: ['elasticsearch', 'urllib3']
```

## 20.10.5 Sample action file

- close indices

```
actions:
 1:
 action: close
 description: >-
 Close indices older than 30 days (based on index name), for logstash-
 prefixed indices.
 options:
 delete_aliases: False
 timeout_override:
 continue_if_exception: False
 disable_action: True
 filters:
 - filtertype: pattern
 kind: prefix
 value: logstash-
 exclude:
 - filtertype: age
 source: name
 direction: older
 timestring: '%Y.%m.%d'
 unit: days
 unit_count: 30
 exclude:
```

- delete indices

```
actions:
 1:
 action: delete_indices
 description: >-
 Delete indices older than 45 days (based on index name), for logstash-
 prefixed indices. Ignore the error if the filter does not result in an
 actionable list of indices (ignore_empty_list) and exit cleanly.
 options:
 ignore_empty_list: True
 timeout_override:
 continue_if_exception: False
```

(continues on next page)

(continued from previous page)

```

 disable_action: True
 filters:
 - filtertype: pattern
 kind: prefix
 value: logstash-
 exclude:
 - filtertype: age
 source: name
 direction: older
 timestring: '%Y.%m.%d'
 unit: days
 unit_count: 45
 exclude:

```

- forcemerge segments

```

actions:
 1:
 action: forcemerge
 description: >-
 forceMerge logstash- prefixed indices older than 2 days (based on index
 creation_date) to 2 segments per shard. Delay 120 seconds between each
 forceMerge operation to allow the cluster to quiesce.
 This action will ignore indices already forceMerged to the same or fewer
 number of segments per shard, so the 'forcemerged' filter is unneeded.
 options:
 max_num_segments: 2
 delay: 120
 timeout_override:
 continue_if_exception: False
 disable_action: True
 filters:
 - filtertype: pattern
 kind: prefix
 value: logstash-
 exclude:
 - filtertype: age
 source: creation_date
 direction: older
 unit: days
 unit_count: 2
 exclude:

```

- open indices

```

actions:
 1:
 action: open
 description: >-
 Open indices older than 30 days but younger than 60 days (based on index
 name), for logstash- prefixed indices.
 options:
 timeout_override:
 continue_if_exception: False
 disable_action: True
 filters:
 - filtertype: pattern

```

(continues on next page)

(continued from previous page)

```
kind: prefix
value: logstash-
exclude:
- filtertype: age
 source: name
 direction: older
 timestring: '%Y.%m.%d'
 unit: days
 unit_count: 30
 exclude:
- filtertype: age
 source: name
 direction: younger
 timestring: '%Y.%m.%d'
 unit: days
 unit_count: 60
 exclude:
```

- replica reduce

```
actions:
 1:
 action: replicas
 description: >-
 Reduce the replica count to 0 for logstash- prefixed indices older than
 10 days (based on index creation_date)
 options:
 count: 0
 wait_for_completion: False
 timeout_override:
 continue_if_exception: False
 disable_action: True
 filters:
 - filtertype: pattern
 kind: prefix
 value: logstash-
 exclude:
 - filtertype: age
 source: creation_date
 direction: older
 unit: days
 unit_count: 10
 exclude:
```

## 20.11 Cross-cluster Search

**Cross-cluster search** lets you run a single search request against one or more remote clusters. For example, you can use a cross-cluster search to filter and analyze log data stored on clusters in different data centers.

### 20.11.1 Configuration

1. Use `_cluster` API to add least one remote cluster:

```
curl -u user:password -X PUT "localhost:9200/_cluster/settings?pretty" -H 'Content-Type: application/json' -d'
{
 "persistent": {
 "cluster": {
 "remote": {
 "cluster_one": {
 "seeds": [
 "192.168.0.1:9300"
]
 },
 "cluster_two": {
 "seeds": [
 "192.168.0.2:9300"
]
 }
 }
 }
 }
}
```

1. To search data in index twitter located on the cluster\_one use following command:

```
curl -u user:password -X GET "localhost:9200/cluster_one:twitter/_search?pretty" -H 'Content-Type: application/json' -d'
{
 "query": {
 "match": {
 "user": "kimchy"
 }
 }
}
```

1. To search data in index twitter located on multiple clusters, use following command:

```
curl -u user:password -X GET "localhost:9200/twitter,cluster_one:twitter,cluster_two:twitter/_search?pretty" -H 'Content-Type: application/json' -d'
{
 "query": {
 "match": {
 "user": "kimchy"
 }
 }
}
```

1. Configure index pattern in Kibana GUI to discover data from multiple clusters:

```
cluster_one:logstash-*,cluster_two:logstash-*
```

### Create index pattern

Kibana uses index patterns to retrieve data from Elasticsearch indices for things like visualizations.

☐ Include system indices

#### Step 1 of 2: Define index pattern

Index pattern

cluster\_one:logstash-\*,cluster\_two:logstas

You can use a \* as a wildcard in your index pattern.  
You can't use spaces or the characters \, /, ?, \*, <, >, |.

> Next step

## 20.11.2 Security

Cross-cluster search uses the Elasticsearch transport layer (default 9300/tcp port) to exchange data. To secure the transmission, encryption must be enabled for the transport layer.

Configuration is in the `/etc/elasticsearch/elasticsearch.yml` file:

```
Transport layer encryption
logserverguard.ssl.transport.enabled: true
logserverguard.ssl.transport.pemcert_filepath: "/etc/elasticsearch/ssl/certificate.crt"
logserverguard.ssl.transport.pemkey_filepath: "/etc/elasticsearch/ssl/certificate.key"
logserverguard.ssl.transport.pemkey_password: ""
logserverguard.ssl.transport.pemtrustedcas_filepath: "/etc/elasticsearch/ssl/rootCA.crt"

logserverguard.ssl.transport.enforce_hostname_verification: false
logserverguard.ssl.transport.resolve_hostname: false
```

Encryption must be enabled on each cluster.

## 20.12 Sync/Copy

The Sync/Copy module allows you to synchronize or copy data between two Elasticsearch clusters. You can copy or synchronize selected indexes or indicate index pattern.

### 20.12.1 Configuration

Before starting Sync/Copy, complete the source and target cluster data in the `Profile` and `Create profile` tabs:

- Protocol - http or https;
- Host - IP address ingest node;
- Port - communication port (default 9200);
- Username - username that has permission to get data and save data to the cluster;
- Password - password of the above user
- Cluster name

Logged in as : logserver

Sync Copy Jobs **Profile**

**Create Profile** Profile List

Protocol

HTTP

Host

Port

Username

Password

Cluster Name

Submit

You can view or delete the profile in the Profile List tab.

## 20.12.2 Synchronize data

To perform data synchronization, follow the instructions:

- go to the Sync tab;
- select Source Profile
- select Destination Profile
- enter the index pattern name in Index pattern to sync
- or use switch Toggle to select between Index pattern or name and enter indices name.
- to create synchronization task, press Submit button

Logged in as : logserver

[Sync](#) [Copy](#) [Jobs](#) [Profile](#)

Source Profile

### 20.12.3 Copy data

To perform data copy, follow the instructions:

- go to the `Copy` tab;
- select `Source Profile`
- select `Destination Profile`
- enter the index pattern name in `Index pattern to sync`
- or use switch `Toggle to select between Index pattern or name` and enter indices name.
- to start copying data press the `Submit` button

### 20.12.4 Running Sync/Copy

Prepared Copy/Sync tasks can be run on demand or according to a set schedule. To do this, go to the `Jobs` tab. With each task you will find the `Action` button that allows:

- running the task;
- scheduling task in Cron format;
- deleting task;
- download task logs.

## 20.13 XLSX Import

The XLSX Import module allow to import your `xlsx` and `csv` file to indices.

### 20.13.1 Importing steps

1. Go to XLSX Import module and select your file and sheet:

XLSX Import

1 Choose a file 2 Setup your index 3 Done

Import your `xlsx` and `csv` file to ElasticSearch

**tasks\_logs.xlsx**  
[Remove](#)

Select the sheet to import

Arkusz1 [> Next](#)

Date	Duration	Task
2020-06-01T00:00:00	1	Task1
2020-06-02T00:00:00	2	Task2
2020-06-03T00:00:00	0.05	Task3
2020-06-04T00:00:00	0.050694444	Task4

After the data has been successfully loaded, you will see a preview of your data at the bottom of the window.

Press **Next** button.

1. In the next step, enter the index name in the `Index name` field, you can also change the pattern for the document ID and select the columns that the import will skip.

## Index name

task\_logs

Name the elasticsearch index that will be created. If the index is already existing, documents will be added or updated according to the chosen docID

## Custom docID

line{ \_line }-{ \_uid }

example rendering

line1337-ePqwGNw3dsJU

Import will provide a unique document identifier linked to the line number of the imported file. You can customize this doc ID using special reserved variables : { \_uid } for an auto-generated identifier, { \_importedLine } for the current line number, or { <column-name> } to access a value of the imported line.

## Removing columns

	▼
Date	
Duration	
Task	
Europe/Berlin	▼

Excel does not manage timezone within date format cells. Define your file content timezone to index its date fields in a correct way.

☐ ☒ Configure your own mapping ⓘ

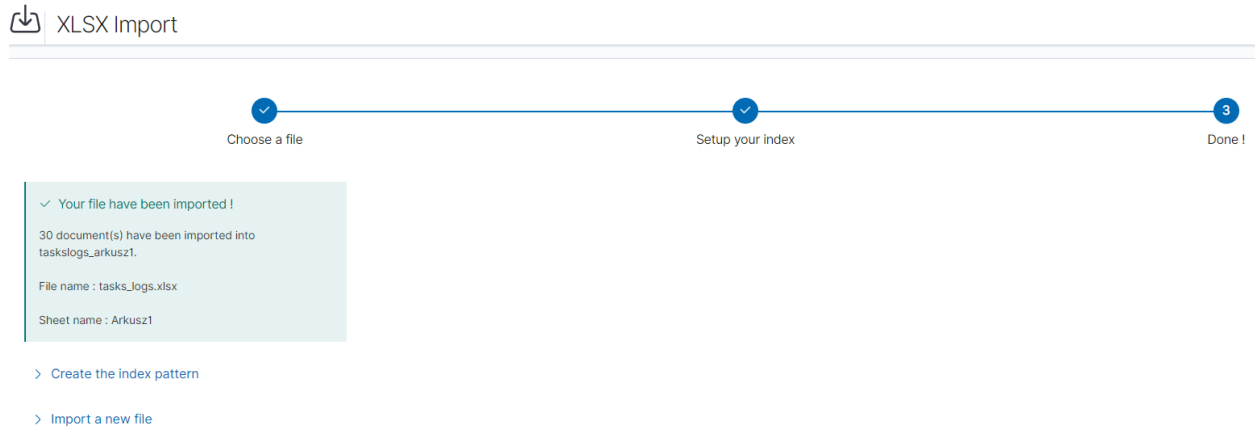

☐ ☒ Add ingest pipeline ids ⓘ

[< back](#)
[📄 Import](#)

1. Select the `Configure your own mapping for every field`. You can choose the type and apply more options with the advanced JSON. The list of parameters can be found here, <https://www.elastic.co/guide/en/elasticsearch/reference/7.x/mapping-params.html>
2. After the import configuration is complete, select the `Import` button to start the import process.

- After the import process is completed, a summary will be displayed. Now you can create a new index pattern to view your data in the Discovery module.

## 20.14 Logtrail

LogTrail module allow to view, analyze, search and tail log events from multiple indices in realtime. Main features of this module are:

- View, analyze and search log events from a centralized interface
- Clean & simple devops friendly interface
- Live tail
- Filter aggregated logs by hosts and program
- Quickly seek to logs based on time
- Supports highlighting of search matches
- Supports multiple Elasticsearch index patterns each with different schemas
- Can be extended by adding additional fields to log event
- Color coding of messages based on field values

Default Logtrail configuration, keeps track of event logs for Elasticsearch, Logstash, Kibana and Alert processes. The module allows you to track events from any index stored in Elasticsearch.

### 20.14.1 Configuration

The LogTrail module uses the Logstash pipeline to retrieve data from any of the event log files and save its contents to the Elasticsearch index.

### 20.14.2 Logstash configuration

Example for the file `/var/log/messages`

- Add the Logstash configuration file in the correct pipeline (default is “logtrail”):

```
vi /etc/logstash/conf.d/logtrail/messages.conf
```

```
input {
 file {
 path => "/var/log/messages"
 start_position => beginning
 tags => "logtrail_messages"
 }
}
filter {
 if "logtrail_messages" in [tags] {
 grok {
 match => {
 # "message" => "%{SYSLOGTIMESTAMP:syslog_timestamp}
 => %{SYSLOGHOST:hostname} %{DATA:program} (?:\[%{POSINT:pid} \])?: %
 => {GREEDYDATA:syslog_message}"
 # If syslog is format is "<%PRI%><%syslogfacility%>%TIMESTAMP% %HOSTNAME%
 => %syslogtag%msg:::sp-if-no-1st-sp%msg:::drop-last-lf%\n"
 "message" => "<?%{NONNEGINT:priority}><%
 => {NONNEGINT:facility}>%{SYSLOGTIMESTAMP:syslog_timestamp} %{SYSLOGHOST:hostname}
 => %{DATA:program} (?:\[%{POSINT:pid} \])?: %{GREEDYDATA:syslog_message}"
 }
 }
 date {
 match => ["syslog_timestamp", "MMM d HH:mm:ss", "MMM dd
 => HH:mm:ss"]
 }
 ruby {
 code => "event.set('level',event.get('priority').to_i -
 => (event.get('facility').to_i * 8))"
 }
 }
}
output {
 if "logtrail_messages" in [tags] {
 elasticsearch {
 hosts => "http://localhost:9200"
 index => "logtrail-messages-%{+YYYY.MM}"
 user => "logstash"
 password => "logstash"
 }
 }
}
```

## 2. Restart the Logstash service

```
systemctl restart logstash
```

### 20.14.3 Kibana configuration

1. Set up a new pattern index `logtrail-messages*` in the Energy Logserver configuration. The procedure is described in the chapter *First login*.
2. Add a new configuration section in the LogTrail configuration file:

```
vi /usr/share/kibana/plugins/logtrail/logtrail.json
```

```
{
 "index_patterns" : [
 {
 "es": {
 "default_index": "logstash-message-*",
 "allow_url_parameter": false
 },
 "tail_interval_in_seconds": 10,
 "es_index_time_offset_in_seconds": 0,
 "display_timezone": "Etc/UTC",
 "display_timestamp_format": "MMM DD HH:mm:ss",
 "max_buckets": 500,
 "default_time_range_in_days" : 0,
 "max_hosts": 100,
 "max_events_to_keep_in_viewer": 5000,
 "fields" : {
 "mapping" : {
 "timestamp" : "@timestamp",
 "display_timestamp" : "@timestamp",
 "hostname" : "hostname",
 "program": "program",
 "message": "syslog_message"
 },
 "message_format": "{{syslog_message}}"
 },
 "color_mapping" : {
 "field": "level",
 "mapping" : {
 "0": "#ff0000",
 "1": "#ff3232",
 "2": "#ff4c4c",
 "3": "#ff7f24",
 "4": "#ffb90f",
 "5": "#a2cd5a"
 }
 }
 }
]
}
```

### 3. Restate the Kibana service

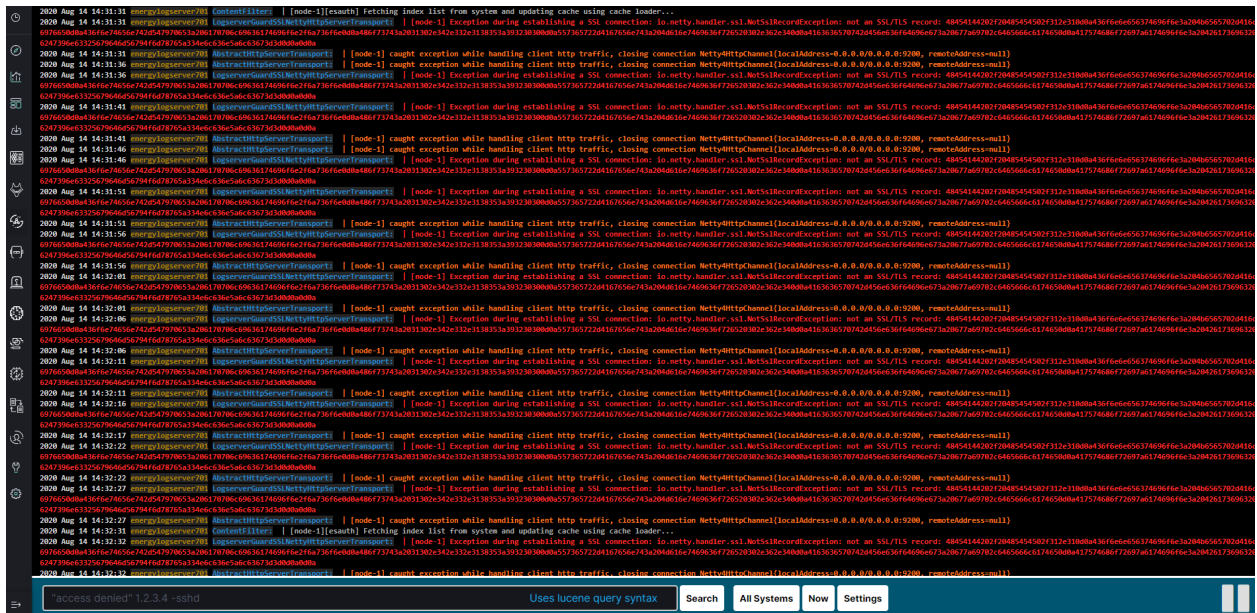

```
systemctl restart kibana
```

## 20.14.4 Using Logtrail

To access of the LogTrail module, click the tile icon from the main menu bar and then go to the „LogTrail” icon.

The main module window contains the content of messages that are automatically updated.

Below is the search and options bar.

It allows you to search for event logs, define the systems from which events will be displayed, define the time range for events and define the index pattern.

## 21.1 Recovery default base indexes

Only applies to versions 6.1.5 and older. From version 6.1.6 and later, default indexes are created automatically

If you lost or damage following index:

Index name	Index ID
.security	Pfq6nNXOSSmGhq2fcxFNg
.taskmanagement	E2Pwp4xxTkSc0gDhsE-vvQ
alert_status	fkqks4JlQnuqiqYmOFLpsQ
audit	cSQkDUdiSACo9WlTpc1zrw
alert_error	9jGh2ZNDRunU0NsB3jtDhA
alert_past	lUyTN1CPTpqm8eDgG9AYnw
.trustedhost	AKKfcpsATj6M4B_4VD5vIA
.kibana	cmN5W7ovQpW5kfaQ1xqf2g
.scheduler_job	9G6EEX9CSEWYfoekNcOEMQ
.authconfig	2M01Phg2T-q-rEb2rbfoVg
.auth	ypPGuDrFRu-_ep-iYkgepQ
.reportscheduler	mGroDs-bQyaucfY3-smDpg
.authuser	zXotLpfeRnuzOYkTJpsTaw
alert_silence	ARTo7ZwdRL67KhW_HAIkmw
.elastfilter	TtpZrPnrRGWQlWGkTOETzw
alert	RE6EM4FfR2WTn-JsZlvm5Q
.alertrules	SzV22qrORHyY9E4kGPQOtg

You may to recover it from default installation folder with following steps:

1. Stop Logstash instances which load data into cluster

```
systemctl stop logstash
```

2. Disable shard allocation

```
PUT _cluster/settings
{
 "persistent": {
 "cluster.routing.allocation.enable": "none"
 }
}
```

3. Stop indexing and perform a synced flush

```
POST _flush/synced
```

4. Shutdown all nodes:

```
systemctl stop elasticsearch.service
```

5. Copy appropriate index folder from installation folder to Elasticsearch cluster data node folder (example of .auth folder)

```
cp -rf ypPGuDrFRu-_ep-iYkgepQ /var/lib/elasticsearch/nodes/0/indices/
```

6. Set appropriate permission

```
chown -R elasticsearch:elasticsearch /var/lib/elasticsearch/
```

7. Start all Elasticsearch instance

```
systemctl start elasticsearch
```

8. Wait for yellow state of Elasticsearch cluster and then enable shard allocation

```
PUT _cluster/settings
{
 "persistent": {
 "cluster.routing.allocation.enable": "all"
 }
}
```

9. Wait for green state of Elasticsearch cluster and then start the Logstash instances

```
systemctl start logstash
```

## 21.2 Too many open files

If you have a problem with too many open files by the Elasticsearch process, modify the values in the following configuration files:

- /etc/sysconfig/elasticsearch
- /etc/security/limits.d/30-elasticsearch.conf
- /usr/lib/systemd/system/elasticsearch.service

Check these three files for:

- LimitNOFILE=65536
- elasticsearch nofile 65537

- MAX\_OPEN\_FILES=65537

Changes to service file require:

```
systemctl daemon-reload
```

And changes to limits.d require:

```
sysctl -p /etc/sysctl.d/90-elasticsearch.conf
```

## 21.3 The Kibana status code 500

If the login page is displayed in Kibana, but after the attempt to login, the browser displays “error: 500”, and the logs will show entries:

```
Error: Failed to encode cookie (sid-auth) value: Password string too short (min 32_
↳characters required).
```

Generate a new server.ironsecret with the following command:

```
echo "server.ironsecret: \"$(</dev/urandom tr -dc _A-Z-a-z-0-9 | head -c32)\\"" >> /
↳etc/kibana/kibana.yml
```

## 21.4 Diagnostic tool

Energy Logserver includes a diagnostic tool that helps solve your problem by collecting system data necessary for problem analysis by the support team.

The diagnostic tool is located in the installation directory: `utils/diagnostic-tool.sh`

Diagnostic tool collect the following information:

- configuration files for Kibana, Elasticsearch, Alert
- logs file for Kibana, Alert, Cerebro, Elasticsearch
- Cluster information from Elasticsearch API

When the diagnostic tool collects data, the credentials are removed from the content of the files.

### 21.4.1 Running the diagnostic tool

To run the diagnostic tool, you must provide three parameters: - user assigned admin role, default ‘logserver’ - user password; - URL of cluster API, default: `http://localhost:9200`

Example of a command:

```
./diagnostic-tool.sh $user $password http://localhost:9200
```

The diagnostic tool saves the results to `.tar` file located in the user’s home directory.

You can check the current version using the API command:

```
curl -u $USER:$PASSWORD -X GET http://localhost:9200/license
```

## 22.1 Upgrade from version 7.0.1

### 22.1.1 General note

- Update the kibana role to include index-pattern `.kibana*`
- Update the alert role to include index-pattern `.alertrules*` and `alert_status*`
- Install `python36` which is required for the Alerting engine on client-node:

```
yum install python3
```

- AD users should move their saved objects from the `adrole`.
- Indicators of compromise (IOCs auto-update) require access to the software provider's servers.
- GeoIP Databases (auto-update) require access to the software provider's servers.

### 22.1.2 Upgrade steps

- Stop services

```
systemctl stop elasticsearch alert kibana
```

- Upgrade client-node (includes alert engine)

```
yum update ./energy-logserver-client-node-7.0.2-1.el7.x86_64.rpm
```

- Login in the GUI Energy Logserver and go to the `Alert List` on the `Alerts` tab and click `SAVE` button

- Start alert and kibana service

```
systemctl start alert kibana
```

- Upgrade data-node

```
yum update ./energy-logserver-data-node-7.0.2-1.el7.x86_64.rpm
```

- Start services

```
systemctl start elasticsearch alert
```

### Extra note

If the Elasticsearch service has been started on the client-node, then it is necessary to update the **client.rpm** and **data.rpm** packages on the client node.

After update, you need to edit:

```
/etc/elasticsearch/elasticsearch.yml
```

and change:

```
node.data: false
```

Additionally, check the file:

```
elasticsearch.yml.rpmnew
```

and complete the configuration in `elasticsearch.yml` with additional lines.

## 22.2 Changing OpenJDK version

### 22.2.1 Logstash

OpenJDK 11 is supported by Logstash from version 6.8 so if you have an older version of Logstash you must update it.

To update Logstash, follow the steps below:

1. Back up the following files
  - `/etc/logstash/logstash.yml`
  - `/etc/logstash/pipelines.yml`
  - `/etc/logstash/conf.d`
2. Use the command to check custom Logstash plugins:

```
/usr/share/bin/logstash-plugin list --verbose
```

and note the result

3. Install a newer version of Logstash according to the instructions:

<https://www.elastic.co/guide/en/logstash/6.8/upgrading-logstash.html>

or

<https://www.elastic.co/guide/en/logstash/current/upgrading-logstash.html>

4. Verify installed plugins:

```
/usr/share/bin/logstash-plugin list --verbose
```

5. Install the missing plugins if necessary:

```
/usr/share/bin/logstash-plugin install plugin_name
```

6. Run Logstash using the command:

```
systemctl start logstash
```

## 22.2.2 Elasticsearch

Energy Logserver can use OpenJDK version 10 or later. If you want to use OpenJSK version 10 or later, configure the Elasticsearch service as follows:

1. After installing OpenJDK, select the correct version that Elasticsearch will use:

```
alternative --config java
```

2. Open the `/etc/elasticsearch/jvm.options` file in a text editor:

```
vi /etc/elasticsearch/jvm.options
```

3. Disable the OpenJDK version 8 section:

```
JDK 8 GC logging

#8:-XX:+PrintGCDetails
#8:-XX:+PrintGCDateStamps
#8:-XX:+PrintTenuringDistribution
#8:-XX:+PrintGCApplicationStoppedTime
#8:-Xloggc:/var/log/elasticsearch/gc.log
#8:-XX:+UseGCLogFileRotation
#8:-XX:NumberOfGCLogFiles=32
#8:-XX:GCLogFileSize=64m
```

4. Enable the OpenJDK version 11 section

```
G1GC Configuration
NOTE: G1GC is only supported on JDK version 10 or later.
To use G1GC uncomment the lines below.
10-:-XX:-UseConcMarkSweepGC
10-:-XX:-UseCMSInitiatingOccupancyOnly
10-:-XX:+UseG1GC
10-:-XX:InitiatingHeapOccupancyPercent=75
```

5. Restart the Elasticsearch service

```
systemctl restart elasticsearch
```

## CHAPTER 23

### Agents module

The Agents module is used for the central management of agents used in Energy Logserver such as Filebeat, Winlogbeat, Packetbeat, Metricbeat. # Agent installation # All necessary components can be found in the installation folder `${installation_folder}/utils/agents_bin`.

### 23.1 Component modules

The software consists of two modules:

- Plugin Agents - installation just like any standard Kibana plugin. Before you run the module for the first time, you must add the mapping for the `.agents` index with the `create_template.sh` script
- MasterAgent software - installed on host with agent (like beats);

### 23.2 Table of configuration parameter for Agent software

Parameter	Work type	Required	Default value
Description			
port	Agent	No	40000
The port on which the agent is listening			
host	Agent	No	Read from system
The address on which the agent is listening			
hostname	Agent	No	Read from system
Host name (hostname)			
autoregister	Agent	No	24
How often the agent's self-registration should take place. Time in hours			
metricbeat_path	Agent	No	./
Catalog for meatricbeat			
filebeat_path	Agent	No	./
Directory for filebeat			

(continues on next page)

(continued from previous page)

winlogbeat_path	Agent	No	./	↵
↪  Catalog <b>for</b> winlogbeat				
packetbeat_path	Agent	No	./	↵
↪  Catalog <b>for</b> packetbeat				
custom_list	Agent	No	Not defiend	↵
↪  List of files <b>and</b> directories to scan. If a directory <b>is</b> specified, files <b>with</b>				
↪ the yml extension are registered <b>with</b> it. The file / directory separator <b>is</b> the				
↪ character ";"				
createfile_folder	Agent	No	Not defiend	↵
↪  List of directories where files can be created. The catalogs are separated by the				
↪ symbol ";". These directories are <b>not</b> scanned <b>for</b> file registration.				
logstash	Agent	No	https://	
↪ localhost:8080  Logstash address <b>for</b> agents				
https_keystore	Agent <b>and</b> Masteragent	No	./lig.keystore	↵
↪  Path to the SSL certificate file.				
https_keystore_pass	Agent <b>and</b> Masteragent	No	admin	↵
↪  The password <b>for</b> the certificate file				
connection_timeout	Agent <b>and</b> Masteragent	No	5	↵
↪  Timeout <b>for</b> https calls given <b>in</b> seconds.				
connection_reconnect	Agent <b>and</b> Masteragent	No	5	↵
↪  Time <b>in</b> seconds that the agent should <b>try</b> to connect to the Logstash <b>if</b> error				
↪ occur				

## 23.3 Installing agent software

The Agent's software requires the correct installation of a Java Runtime Environment. The software has been tested on Oracle Java 8. It is recommended to run the Agent as a service in a given operating system.

1. Generating the certificates - EDIT DOMAIN, DOMAIN\_IP - use this scripts:

- create CA certificate and key:

```
#!/bin/bash
DOMAIN="localhost"
DOMAIN_IP="192.168.0.1"
COUNTRYNAME="PL"
STATE="Poland"
COMPANY="ACME"

openssl genrsa -out rootCA.key 4096

echo -e "${COUNTRYNAME}\n${STATE}\n\n${COMPANY}\n\n\n" | openssl req -
↪ x509 -new -nodes -key rootCA.key -sha256 -days 3650 -out rootCA.crt
```

- create certificate and key for you domain:

```
#!/bin/bash
DOMAIN="localhost"
DOMAIN_IP="192.168.0.1"
COUNTRYNAME="PL"
STATE="Poland"
COMPANY="ACME"

openssl genrsa -out ${DOMAIN}.pre 2048
openssl pkcs8 -topk8 -inform pem -in ${DOMAIN}.pre -outform pem -out ${DOMAIN}.
↪ key -nocrypt
```

(continues on next page)

(continued from previous page)

```

openssl req -new -sha256 -key ${DOMAIN}.key -subj "/C=${COUNTRYNAME}/ST=${STATE}/
↪O=${COMPANY}/CN=${DOMAIN}" -reqexts SAN -config <(cat /etc/pki/tls/openssl.cnf
↪<(printf "[SAN]\nsubjectAltName=DNS:${DOMAIN},IP:${DOMAIN_IP}") -out ${DOMAIN}.
↪csr

openssl x509 -req -in ${DOMAIN}.csr -CA rootCA.crt -CAkey rootCA.key -
↪CAcreateserial -out ${DOMAIN}.crt -sha256 -extfile <(printf "[req]\ndefault_
↪bits=2048\ndistinguished_name=req_distinguished_name\nreq_extensions=req_
↪ext\n[req_distinguished_name]\ncountryName=${COUNTRYNAME}\nstateOrProvinceName=${
↪STATE}\norganizationName=${COMPANY}\ncommonName=${DOMAIN}\n[req_
↪ext]\nsubjectAltName=@alt_names\n[alt_names]\nDNS.1=${DOMAIN}\nIP=${DOMAIN_IP}\n
↪") -days 3650 -extensions req_ext

```

- to verify certificate use following command:

```
openssl x509 -in ${DOMAIN}.crt -text -noout
```

- creating Java keystore, you will be asked for the password for the certificate key and whether the certificate should be trusted - enter “yes”

```

#!/bin/bash
DOMAIN="localhost"
DOMAIN_IP="192.168.0.1"
COUNTRYNAME="PL"
STATE="Poland"
COMPANY="ACME"
keytool -import -file rootCA.crt -alias root -keystore root.jks -storetype jks
openssl pkcs12 -export -in ${DOMAIN}.crt -inkey ${DOMAIN}.pre -out node_name.
↪p12 -name "${DOMAIN}" -certfile rootCA.crt

```

## 2. Linux host configuration

- To install the MasterAgent on Linux RH / Centos, the net-tools package must be installed:

```
yum install net-tools
```

- Add an exception to the firewall to listen on TCP 8080 and 8081:

```

firewall-cmd --permanent --zone public --add-port 8080/tcp
firewall-cmd --permanent --zone public --add-port 8081/tcp

```

- Logstash - Configuration

```

/bin/cp -rf ./logstash/agents_template.json /etc/logstash/templates.d/
mkdir /etc/logstash/conf.d/masteragent
/bin/cp -rf ./logstash/*.conf /etc/logstash/conf.d/masteragent/

/etc/logstash/pipelines.yml:
- pipeline.id: masteragent
 path.config: "/etc/logstash/conf.d/masteragent/*.conf"

mkdir /etc/logstash/conf.d/masteragent/ssl
/bin/cp -rf ./certificates/localhost.key /etc/logstash/conf.d/masteragent/ssl/
/bin/cp -rf ./certificates/localhost.crt /etc/logstash/conf.d/masteragent/ssl/
/bin/cp -rf ./certificates/rootCA.crt /etc/logstash/conf.d/masteragent/ssl/
chown -R logstash:logstash /etc/logstash

```

- Masterbeat - Installation

```
/bin/cp -rf ./agents/linux /opt/agents
/bin/cp -rf ./agents/linux/agents/linux/MasterBeatAgent.conf /opt/agents/agent.conf
/bin/cp -rf ./certificates/node_name.pl2 /opt/agents/
/bin/cp -rf ./certificates/root.jks /opt/agents/
chown -R kibana:kibana /opt/agents
```

- **Linux Agent - Installation**

```
/bin/cp -rf ./agents/linux/masteragent /opt/masteragent
/bin/cp -rf ./certificates/node_name.pl2 /opt/masteragent
/bin/cp -rf ./certificates/root.jks /opt/masteragent
/bin/cp -rf ./agents/linux/masteragent/masteragent.service
/usr/lib/systemd/system/masteragent.service
systemctl daemon-reload
systemctl enable masteragent
systemctl start masteragent
```

- Download MasterBeatAgent.jar and agent.conf files to any desired location;
- Upload a file with certificates generated by the keytool tool to any desired location;
- Update entries in the agent.conf file (the path to the key file, paths to files and directories to be managed, the Logstash address, etc.);

- The agent should always be run with an indication of the working directory in `agent.conf` which the `agent.conf` file is located;

- The Agent is started by the `java -jar MasterBeatAgent.jar` command.
- Configuration of the `/etc/systemd/system/masteragent.service` file:

```
[Unit]
 Description=Manage MasterAgent service
 Wants=network-online.target
 After=network-online.target

[Service]
 WorkingDirectory=/opt/agent
 ExecStart=/bin/java -jar MasterBeatAgent.jar
 User=root
 Type=simple
 Restart=on-failure
 RestartSec=10

[Install]
 WantedBy=multi-user.target
```

- After creating the file, run the following commands:

```
systemctl daemon-reload
systemctl enable masteragent
systemctl start masteragent
```

## 1. Windows host configuration

- Download the latest version of MasterAgent, which includes:
  - Agents.jar;
  - agents.exe;

- agent.conf;
- agents.xml;
- lig.keystore;
- Add an exception to the firewall to listen on TCP port 8081;
- Add an exception to the firewall to allow connection on TCP port 8080 with remote hosts;
- Copy Master Agent files to installation directory: “C:\Program Files\MasterAgent”
- To install the service, start the PowerShell console as an administrator and execute the following commands:

```
New-Service -name masteragent -displayName masteragent -binaryPathName
↪ "C:\Program Files\MasterAgent\agents.exe"
```

- Check status of the services

```
cd C:\Program Files\MasterAgent
agents.exe status
```

## 23.4 TLS configuration

The default agent uses TLS 1.2 for communication. In addition, you can disable the agent’s ability to use weak protocols and change other cryptographic options, such as the length of the Diffie-Hellman key.

- Create a configuration file agent.security:

```
vi /opt/agent/agent.security
```

- Add the necessary configuration, for example:

```
jdk.tls.disabledAlgorithms=SSLv2Hello, SSLv3, TLSv1, TLSv1.1, RC4, DES,
↪ MD5withRSA, DH keySize < 2048, \
 EC keySize < 224, 3DES_EDE_CBC, anon, NULL
```

- Add a new configuration to the service unit:

```
systemctl edit --full masteragent.service
```

- Add the following line:

```
[Unit]
Description=Manage MasterAgent service
Wants=network-online.target
After=network-online.target

[Service]
WorkingDirectory=/opt/agent
- ExecStart=/bin/java -jar MasterBeatAgent.jar
+ ExecStart=/bin/java -Djava.security.properties=/opt/agent/agent.security -jar
↪ MasterBeatAgent.jar
User=root
Type=simple
Restart=on-failure
RestartSec=10
```

(continues on next page)

(continued from previous page)

```
[Install]
WantedBy=multi-user.target
```

- Reload daemon and restart service

```
systemctl daemon-reload
systemctl restart masteragent.service
```

## 23.5 The agent management

The GUI console is used to manage agents. In the **Agents** tab, you can find a list of connected agents. There are typical information about agents such as:

- Host name;
- OS name;
- IP Address;
- TCP port;
- Last revision;

Agents						
Agents List						
<input type="text" value="Search a hostname"/> <input type="text" value="Search a IP"/>		<input type="button" value="Reindex"/> <input type="button" value="↺"/>				
Host name	OS	IP	Port	Last revision	Actions agent	Actions files
host01-test	Linux	10.0.6.7	8081	2019-04-25 14:28:10	<input type="button" value="Drop"/>	<input type="button" value="+ Create"/> <input type="button" value="Show"/>
host02-test	Windows 10	192.168.3.52	8081	2019-04-25 12:36:16	<input type="button" value="Drop"/>	<input type="button" value="+ Create"/> <input type="button" value="Show"/>
host03-test	Linux	192.168.3.193	8081	2019-05-15 11:11:01	<input type="button" value="Drop"/>	<input type="button" value="+ Create"/> <input type="button" value="Show"/>
host04-test	Linux	10.0.6.5	8081	2019-05-15 11:25:06	<input type="button" value="Drop"/>	<input type="button" value="+ Create"/> <input type="button" value="Show"/>

Additionally, for each connected agent, you can find action buttons such as:

- Drop - to remove the agent configuration from the GUI;
- Create - to create new configuration files;
- Show - it is used to display the list of created configuration files;

### 23.5.1 Creating a new configuration file

host04-test	Linux	10.0.6.5	8081	2019-05-15 11:25:06	Drop	<b>+ Create</b>	Show
-------------	-------	----------	------	---------------------	------	-----------------	------

**Folders**

/etc/filebeat

**File name**

new\_file

**Content**

New content

Submit

To add a new configuration file press the **Create** button, add a new file **name**, add a new **path** where the file should be saved and the context of the new configuration file. The new file will be saved with the extension \*.yaml.

### 23.5.2 Editing configuration file

To display a list of configuration files available for a given host, press the Show button.

A list of configuration files will be displayed, and the following options for each of them:

- Show - displays the contents of the file;
- Edit - edit the contents of the file;
- Delete - deletes the file.

To edit the file, select the Edit button, then enter the changes in the content window, after finishing select the Submit button.

After changing or adding the agent configuration, restart the agent by clicking the `Reload config` button.

Agents List							
Agents List							Reindex
<input type="text" value="win"/> Search a IP							
Host name	OS	IP	Port	Last revision	Actions agent	Actions files	
win2012ad	Windows Server 2012 R2	192.168.3.15	9999	2020-09-19 07:04:25	Drop <b>Reload config</b>	+ Create	Show

### 24.1 Skimmer

Energy Logserver uses a monitoring module called Skimmer to monitor the performance of its hosts. Metrics and conditions of services are retrieved using the API.

The services that are supported are:

- Elasticsearch data node metric;
- Elasticsearch indexing rate value;
- Logstash;
- Kibana;
- Metricbeat;
- Pacemaker;
- Zabbix;
- Zookeeper;
- Kafka;
- Kafka consumers lag metric
- Httpbeat;
- Elastalert;
- Filebeat

and other.

## 24.2 Skimmer Installation

The RPM package `skimmer-x86_64.rpm` is delivered with the system installer in the “utils” directory:

```
cd $install_directoty/utils
yum install skimmer-1.0.XX-x86_64.rpm -y
```

## 24.3 Skimmer service configuration

The Skimmer configuration is located in the `/usr/share/skimmer/skimmer.conf` file.

```
[Global] - applies to all modules
path to log file
log_file = /var/log/skimmer/skimmer.log

enable debug logging
debug = true

[Main] - collect stats
main_enabled = true
index name in elasticsearch
index_name = skimmer
index_freq = monthly

type in elasticsearch index
index_type = _doc

user and password to elasticsearch api
elasticsearch_auth = logserver:logserver

available outputs
elasticsearch_address = 127.0.0.1:9200
logstash_address = 127.0.0.1:6110

retrieve from api
elasticsearch_api = 127.0.0.1:9200
logstash_api = 127.0.0.1:9600

monitor kafka
kafka_path = /usr/share/kafka/
kafka_server_api = 127.0.0.1:9092
comma separated kafka topics to be monitored, empty means all available topics
kafka_monitored_topics = topic1,topic2
comma separated kafka groups to be monitored, empty means all available groups (if_
↪ kafka_outdated_version = false)
kafka_monitored_groups = group1,group2
switch to true if you use outdated version of kafka - before v.2.4.0
kafka_outdated_version = false

comma separated OS statistics selected from the list [zombie,vm,fs,swap,net,cpu]
os_stats = zombie,vm,fs,swap,net,cpu

comma separated process names to print their pid
processes = /usr/sbin/sshd,/usr/sbin/rsyslogd
```

(continues on next page)

(continued from previous page)

```
comma separated systemd services to print their status
systemd_services = elasticsearch,logstash,alert,cerebro,kibana

comma separated port numbers to print if address is in use
port_numbers = 9200,9300,9600,5514,5044,443,5601,5602

path to directory containing files needed to be csv validated
csv_path = /opt/skimmer/csv/

[PSexec] - run powershell script remotely (skimmer must be installed on Windows)
ps_enabled = false
port used to establish connection
ps_port = 10000

how often (in seconds) to execute the script
ps_exec_step = 60

path to the script which will be sent and executed on remote end
ps_path = /opt/skimmer/skimmer.ps1

available outputs
ps_logstash_address = 127.0.0.1:6111
```

In the Skimmer configuration file, set the credentials to communicate with Elasticsearch:

```
elasticsearch_auth = $user:$password
```

To monitor the Kafka process and the number of documents in the queues of topics, run Skimmer on the Kafka server and uncheck the following section:

```
#monitor kafka
kafka_path = /usr/share/kafka/
kafka_server_api = 127.0.0.1:9092
#comma separated kafka topics to be monitored, empty means all available topics
kafka_monitored_topics = topic1,topic2
#comma separated kafka groups to be monitored, empty means all available groups (if_
↳kafka_outdated_version = false)
kafka_monitored_groups = group1,group2
switch to true if you use outdated version of kafka - before v.2.4.0
kafka_outdated_version = false
```

- kafka\_path - path to Kafka home directory (require kafka-consumer-groups.sh);
- kafka\_server\_api - IP address and port for kafka server API (default: 127.0.0.1:9092);
- kafka\_monitored\_groups - comma separated list of Kafka consumer group, if you do not define this parameter, the command will be invoked with the --all-groups parameter;
- kafka\_outdated\_version = true/false, if you use outdated version of kafka - before v.2.4.0 set: true

After the changes in the configuration file, restart the service.

```
systemctl restart skimmer
```

### 24.3.1 Skimmer GUI configuration

To view the collected data by the skimmer in the GUI, you need to add an index pattern.

Go to the “**Management**” -> “**Index Patterns**” tab and press the “**Create Index Pattern**” button. In the “**Index Name**” field, enter the formula `skimmer- *`, and select the “**Next step**” button. In the “**Time Filter**” field, select `@timestamp` and then press “**Create index pattern**”

In the “**Discovery**” tab, select the `skimmer- *` index from the list of indexes. A list of collected documents with statistics and statuses will be displayed.

### 24.3.2 Skimmer dashboard

To use dashboards and visualization of skimmer results, load dashboards delivered with the product:

```
curl -k -X POST -u$user:$passowrd "https://127.0.0.1:5601/api/kibana/dashboards/
import?force=true" -H 'kbn-xsrf: true' -H 'Content-Type: application/json' -
d@kibana/kibana_objects/skimmer_objects.json
```

### 25.1 Enabling encryption for Apache Kafka clients

Kafka allows you to distribute the load between nodes receiving data and encrypts communication.

Architecture example:

### 25.1.1 The Kafka installation

Documentation during creation.

### 25.1.2 Enabling encryption in Kafka

Generate SSL key and certificate for each Kafka broker

```
keytool -keystore server.keystore.jks -alias localhost -validity {validity} -genkey -
↪keyalg RSA
```

Configuring Host Name In Certificates

```
keytool -keystore server.keystore.jks -alias localhost -validity {validity} -genkey -
↪keyalg RSA -ext SAN=DNS:{FQDN}
```

Verify content of the generated certificate:

```
keytool -list -v -keystore server.keystore.jks
```

### Creating your own CA

```
openssl req -new -x509 -keyout ca-key -out ca-cert -days 365
keytool -keystore client.truststore.jks -alias CARoot -import -file ca-cert
keytool -keystore server.truststore.jks -alias CARoot -import -file ca-cert
```

### Signing the certificate

```
keytool -keystore server.keystore.jks -alias localhost -certreq -file cert-file
openssl x509 -req -CA ca-cert -CAkey ca-key -in cert-file -out cert-signed -days
↳{validity} -CAcreateserial -passin pass:{ca-password}
```

### Import both the certificate of the CA and the signed certificate into the keystore

```
keytool -keystore server.keystore.jks -alias CARoot -import -file ca-cert
keytool -keystore server.keystore.jks -alias localhost -import -file cert-signed
```

If you have trusted certificates, you must import them into the JKS keystore as follows:

#### Create a keystore:

```
keytool -keystore client.keystore.jks -alias localhost -validity 365 -keyalg RSA -
↳genkey
```

### Combine the certificate and key file into a certificate in p12 format:

```
openssl pkcs12 -export -in cert_name.crt -inkey key_name.key -out cert_name.p12 -name_
↳localhost -CAfile ca.crt -caname root
```

### Import the CA certificate into a truststore:

```
keytool -keystore client.truststore.jks -alias CARoot -import -file ca-cert
```

### Import the CA certificate into a keystore:

```
keytool -keystore client.keystore.jks -alias CARoot -import -file ca-cert
```

### Import the p12 certificate into a keystore:

```
keytool -importkeystore -deststorepass MY-KEYSTORE-PASS -destkeystore client.keystore.
↳jks -srckeystore cert_name.p12 -srcstoretype PKCS12
```

## 25.1.3 Configuring Kafka Brokers

In `/etc/kafka/server.properties` file set the following options:

```
listeners=PLAINTEXT://host.name:port,SSL://host.name:port

ssl.keystore.location=/var/private/ssl/server.keystore.jks
ssl.keystore.password=test1234
ssl.key.password=test1234
ssl.truststore.location=/var/private/ssl/server.truststore.jks
ssl.truststore.password=test1234
```

and restart the Kafka service

```
systemctl restart kafka
```

## 25.1.4 Configuring Kafka Clients

Logstash

Configure the output section in Logstash based on the following example:

```
output {
 kafka {
 bootstrap_servers => "host.name:port"
 security_protocol => "SSL"
 ssl_truststore_type => "JKS"
 ssl_truststore_location => "/var/private/ssl/client.truststore.jks"
 ssl_truststore_password => "test1234"
 client_id => "host.name"
 topic_id => "Topic-1"
 codec => json
 }
}
```

Configure the input section in Logstash based on the following example:

```
input {
 kafka {
 bootstrap_servers => "host.name:port"
 security_protocol => "SSL"
 ssl_truststore_type => "JKS"
 ssl_truststore_location => "/var/private/ssl/client.truststore.jks"
 ssl_truststore_password => "test1234"
 consumer_threads => 4
 topics => ["Topic-1"]
 codec => json
 tags => ["kafka"]
 }
}
```

## 25.2 Log retention for Kafka topic

The Kafka durably persists all published records—whether or not they have been consumed—using a configurable retention period. For example, if the retention policy is set to two days, then for the two days after a record is published, it is available for consumption, after which it will be discarded to free up space. Kafka’s performance is effectively constant with respect to data size so storing data for a long time is not a problem.

### 26.1 v7.0.3

#### 26.1.1 NewFeatures

- Alert: new type - Chain - create alert from underlying rules triggered in defined order
- Alert: new type - Logical - create alert from underlying rules triggered with defined logic (OR,AND,NOR)
- Alert: correlate alerts for Chain and Logical types - alert is triggered only if each rule return same value (ip, username, process etc)
- Alert: each triggered alert is indexed with unique alert\_id - field added to default field schema
- Alert: Processing Time visualization on Alert dashboard - easy to identify badly designed alerts
- Alert: support for automatic search link generation
- Input: added mikrotik parsing rules
- Auditing : added IP address field for each action
- Auditing : possibility to exclude values from auditing
- Skimmer: indexing rate visualization
- Skimmer: new metric: offset in Kafka topics
- SKimmer: new metric: expected-datanodes
- MasterAgent: added possibility for beats agents restart and the master agent itself (GUI)

#### 26.1.2 Improvements

- Search and sort support for User List in Config section
- Copy/Sync: now supports “insecure” mode (operations without certificates)

- Fix for “add sample data & web sample dashboard” from Home Page -> changes in default-base-template
- Skimmer: service status check rewritten to dbus api
- Masteragent: possibility to exclude older SSL protocols
- Masteragent: now supports Centos 8 and related distros
- XLSX import: updated to 7.6.1
- Logstash: masteragent pipeline shipped by default
- Blacklist: Name field and Field names in the Fields column & Default field exclusions
- Blacklist: runOnce is only killed on a fatal Alert failure
- Blacklist: IOC excludes threats marked as false-positive
- Incidents: new design for Preview
- Incidents: Note - new feature, ability to add notes to incidents
- Risks: possibility to add new custom value for risk, without the need to index that value
- Alert: much better performance with multithread support - now default
- Alert: Validation of email addresses in the Alerts plugin
- Alert: “Difference” rule description include examples for alert recovery function
- Logtrail: improved the beauty and readability of the plugin
- Security: jquery updated to 3.5.1
- Security: bootstrap updated to 4.5.0
- The HELP button (in kibana) now leads to the official product documentation
- Centralization of previous alert code changes to single module

### 26.1.3 BugFixes

- Individual special characters caused problems in user passwords
- Bad permissions for scheduler of Copy/Sync module has been corrected
- Wrong Alert status in the alert status tab
- Skimmer: forcemerge caused under 0 values for cluster\_stats\_indices\_docs\_per\_sec metric
- diagnostic-tool.sh: wrong name for the archive in output
- Reports: export to csv support STOP action
- Reports: scroll errors in csv exports
- Alert: .alertrules is not a required index for proper system operation
- Alert: /opt/alerts/testrules is not a required directory for proper system operation
- Alert: .riskcategories is not a required index for proper system operation
- Malfunction in Session Timeout
- Missing directives service\_principal\_name in bundled properties.yml
- Blacklist: Removal of the *doc* type in blacklist template
- Blacklist: Problem with “generate\_kibana\_discover\_url: true” directive

- Alert: Overwriting an alert when trying to create a new alert with the same name
- Reports: When exporting dashboards, PDF generates only one page or cuts the page
- Wrong product logo when viewing dashboards in full screen mode

## 26.2 Version 7.0.2

### 26.2.1 New Features

- Manual incident - creating manual incidents from the Discovery section
- New kibana plugin - Sync/Copy between clusters
- Alert: Analyze historical data with defined alert
- Indicators of compromise (IoC) - providing blacklists based on Malware Information Sharing Platform (MISP)
- Automatic update of MaxMind GeoIP Databases [asn, city, country]
- Extended LDAP support
- Cross cluster search
- Diagnostic script to collect information about the environment, log files, configuration files - `utils/diagnostic-tool.sh`
- New beat: `op5beat` - dedicated data shipper from `op5 Monitor`

### 26.2.2 Improvements

- Added `_license` API for elasticsearch (it replaces `license` path which is now deprecated and will stop working in future releases)
- `_license` API now shows **expiration\_date** and **days\_left**
- Visual indicator on **Config** tab for expiring license (for 30 days and less)
- Creating a new user now requires reentering the password
- Complexity check for password fields
- Incidents can be supplemented with notes
- Alert Spike: more detailed description of usage
- ElasticDump added to base installation - `/usr/share/kibana/elasticdump`
- Alert plugin updated - frontend
- Reimplemented session timeout for user activity
- Skimmer: new metrics and dashboard for Cluster Monitoring
- Wazuh config/keys added to `small_backup.sh` script
- Logrotate definitions for Logtrail logfiles
- Incidents can be sorted by Risk value
- UTF-8 support for credentials
- Wazuh: wrong `document_type` and `timestamp` field

### 26.2.3 BugFixes

- Audit: Missing Audit entry for succesfull **SSO** login
- Report: “stderr maxBuffer length exceeded” - export to csv
- Report: “Too many scroll contexts” - export to csv
- Intelligence: incorrect work in updated environments
- Agents: fixed wrong document type
- Kibana: “Add Data to Kibana” from Home Page
- Incidents: the preview button uses the wrong index-pattern
- Audit: Missing information about login errors of ad/ldap users
- Netflow: fix for netflow v9
- MasterAgent: none/certificate verification mode should work as intended
- Incorrect CSS injections for dark theme
- The role could not be removed in specific scenarios

## 26.3 Version 7.0.1

- init
- migrated features from branch 6 [ latest:6.1.8 ]
- XLSX import [kibana]
- curator added to /usr/share/kibana/curator
- node\_modules updated! [kibana]
- elasticsearch upgraded to 7.3.2
- kibana upgraded to 7.3.2
- dedicated icons for all kibana modules
- eui as default framework for login,raports
- bugfix: alerts type description fix
